Course overview

- **Goal**

- The course is about wavelets and multiresolution
 - Theory: 3 hours per week
 - Tuesday 16.30-18.30, room I
 - Wed. 15.30-16.30, room C
 - Laboratory
 - Wed. 16.30-18.30 (Lab. Gamma)

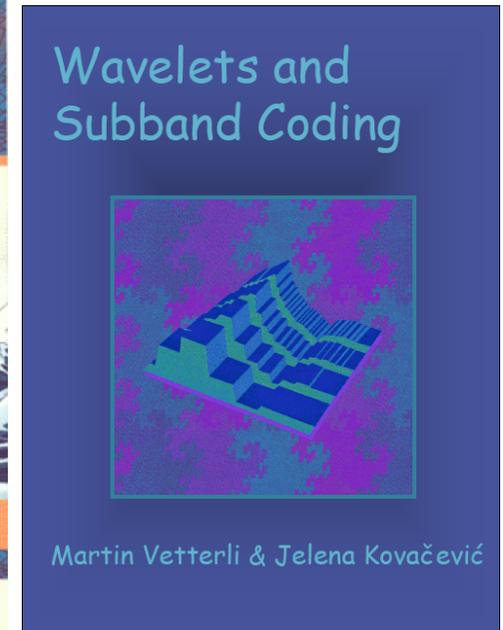

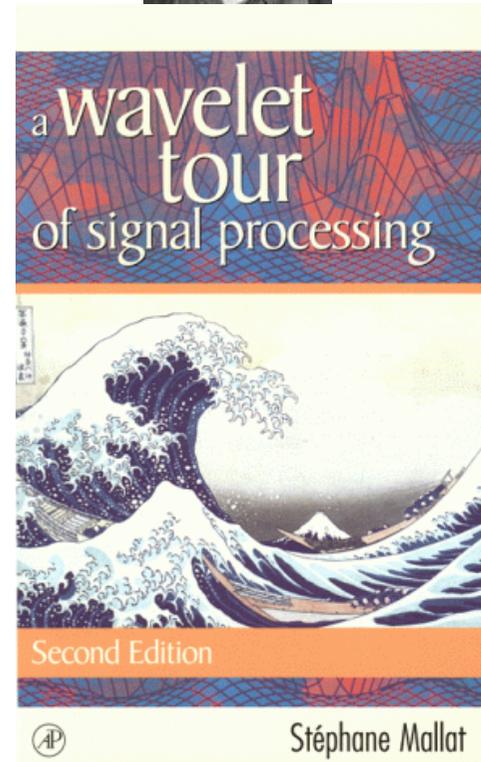

- **Contents**

- Review of Fourier theory
- Wavelets and multiresolution
- Review of Information theoretic concepts
- Applications
 - Image coding (JPEG2000)
 - Feature extraction and signal/image analysis
- Wavelets in vision

- **Exam**

- Oral form
- Can be complemented by a project for the lab.

Telecommunications for Multimedia

Good news

- It is fun!
- Get in touch with the state-of-the-art technology
- Convince yourself that the time spent on maths&stats was not wasted
- Learn how to map theories into applications
- Acquiring the tools for doing good research!

Bad news

- Some theoretical background is unavoidable
 - Mathematics
 - Fourier transform
 - Linear operators
 - Digital filters
 - Wavelet transform
 - (some) Information theory

Issues in multimedia systems

- Broadcasting needs high information carrying capacity
 - Efficient data representation
 - Projection into suitable (perception based?) spaces
 - Color imaging
 - Efficient encoding
 - Reduction of redundancy
 - Classical information theoretical principles (entropy based)
 - Novel approaches based on visual perception (perception based)
- Standardization
 - Openness
 - Ability to adapt to new technologies
 - Flexibility
 - Ability to interact with different media
 - JPEG2000, MPEG4, MPEG7

Mathematical tools

Introduction

- **Sparse representations: few coefficients reveal the information we are looking for.**
 - Such representations can be constructed by decomposing signals over elementary waveforms chosen in a family called a *dictionary*.
 - An orthogonal basis is a dictionary of minimum size that can yield a sparse representation if designed to concentrate the signal energy over a set of few vectors. This set gives a *geometric* signal description.
 - Signal compression and noise reduction
 - Dictionaries of vectors that are larger than bases are needed to build sparse representations of complex signals. But choosing is difficult and requires more complex algorithms.
 - Sparse representations in redundant dictionaries can improve pattern recognition, compression, and noise reduction
- **Basic ingredients: Fourier and Wavelet transforms**
 - They decompose signals over oscillatory waveforms that reveal many signal properties and provide a path to sparse representations

Signals as functions

- CT analogue signals (real valued functions of continuous independent variables)
 - 1D: $f=f(t)$
 - 2D: $f=f(x,y)$ x,y
 - Real world signals (audio, ECG, pictures taken with an analog camera)
- DT analogue signals (real valued functions of discrete variables)
 - 1D: $f=f[k]$
 - 2D: $f=f[i,j]$
 - *Sampled* signals
- Digital signals (discrete valued functions of DT variables)
 - 1D: $y=y[k]$
 - 2D: $y=y[i,j]$
 - *Sampled and discretized* signals

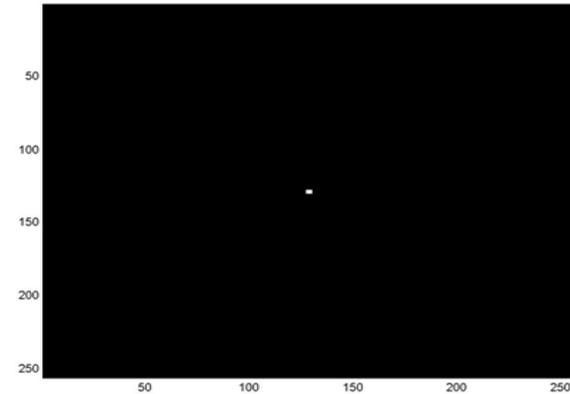

Images as functions

- Gray scale images: 2D functions
 - Domain of the functions: set of (x,y) values for which $f(x,y)$ is defined : 2D lattice $[i,j]$ defining the pixel locations
 - Set of values taken by the function : gray levels
- Digital images can be seen as functions defined over a discrete domain $\{i,j: 0 < i < I, 0 < j < J\}$
 - I, J : number of rows (columns) of the matrix corresponding to the image
 - $f=f[i,j]$: gray level in position $[i,j]$

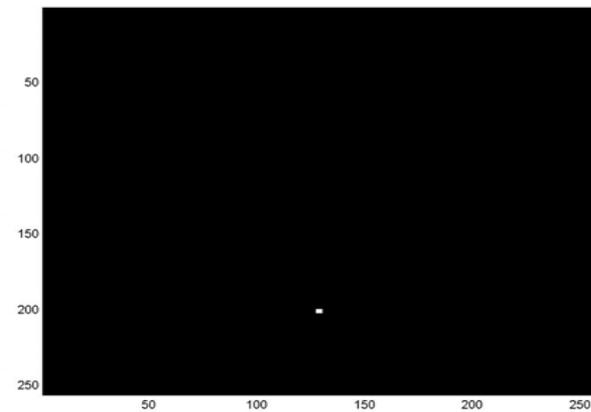

Example 1: δ function

$$\delta[i, j] = \begin{cases} 1 & i = j = 0 \\ 0 & i, j \neq 0; i \neq j \end{cases}$$

$$\delta[i, j - J] = \begin{cases} 1 & i = 0; j = J \\ 0 & \textit{otherwise} \end{cases}$$

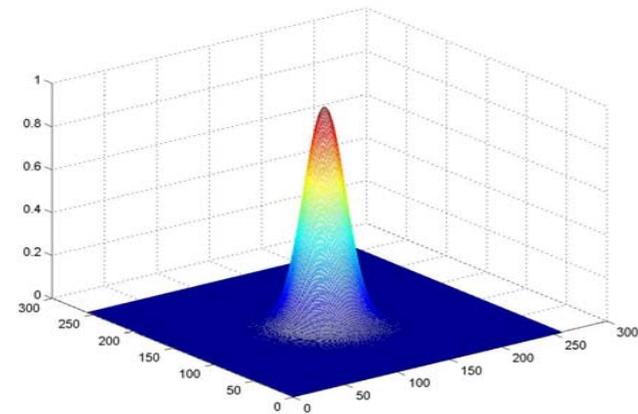

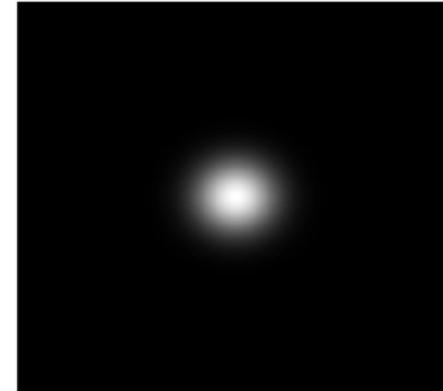

Example 2: Gaussian

Continuous function

$$f(x, y) = \frac{1}{\sigma \sqrt{2\pi}} e^{-\frac{x^2 + y^2}{2\sigma^2}}$$

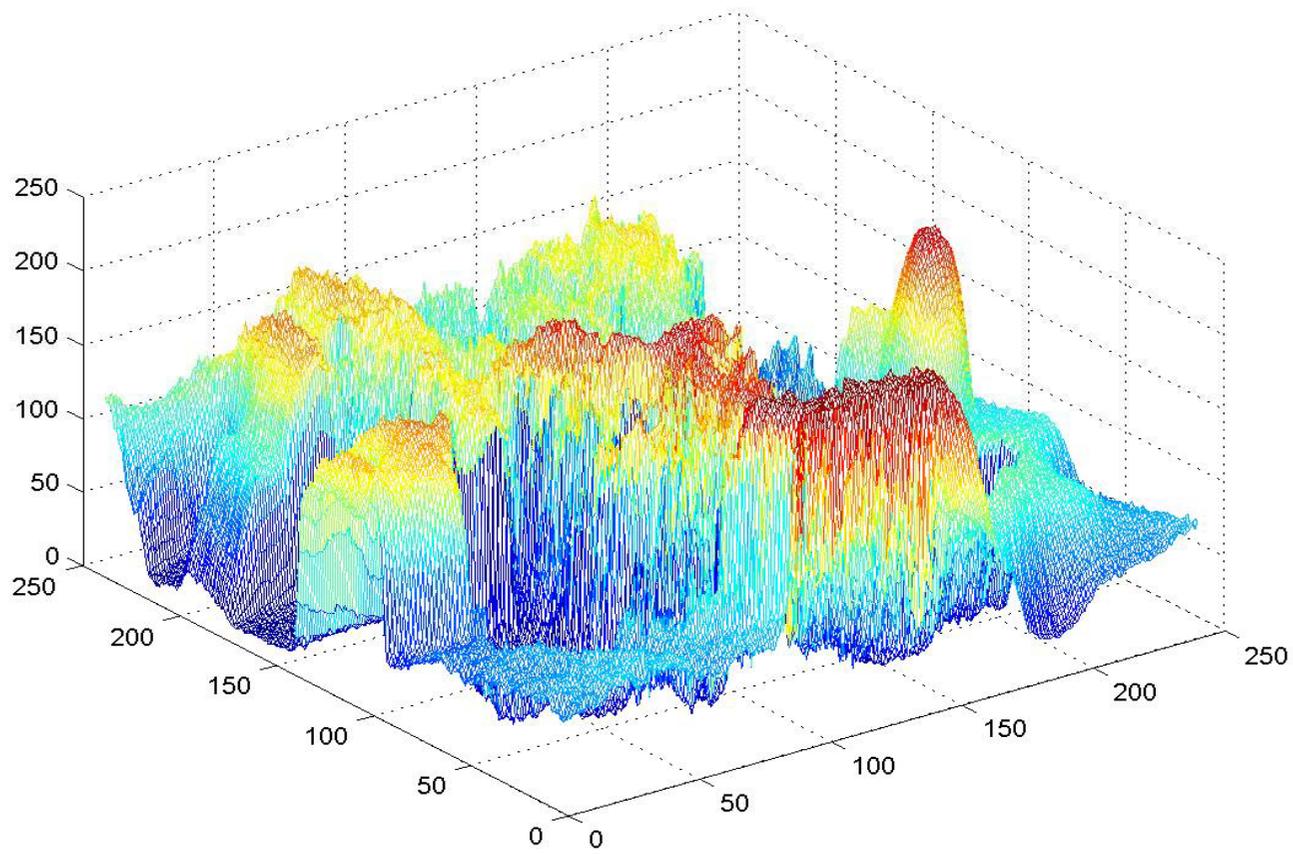

Discrete version

$$f[i, j] = \frac{1}{\sigma \sqrt{2\pi}} e^{-\frac{i^2 + j^2}{2\sigma^2}}$$

Example 3: Natural image

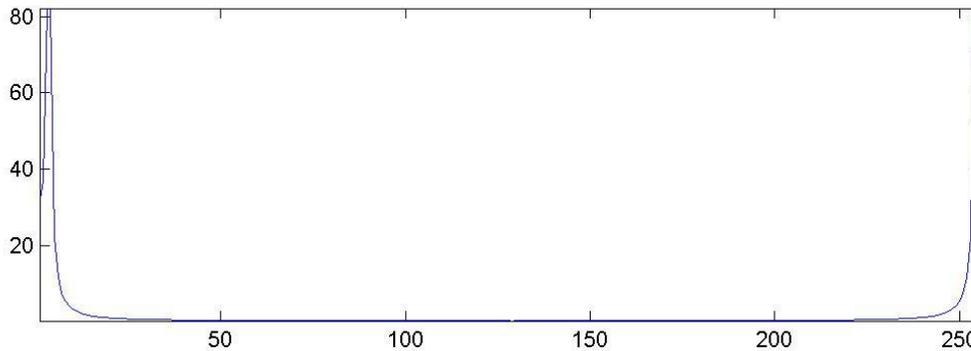

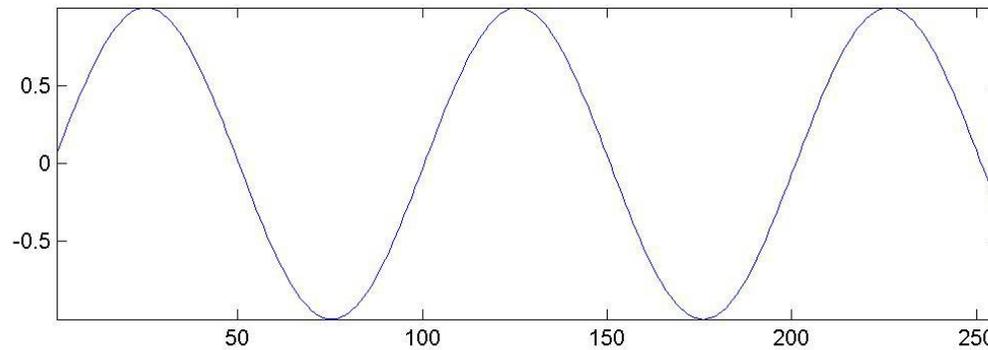

Example 3: Natural image

The Fourier kingdom

- Frequency domain characterization of signals

$$F(\omega) = \int_{-\infty}^{+\infty} f(t)e^{-j\omega t} dt$$

$$f(t) = \int_{-\infty}^{+\infty} F(\omega)e^{j\omega t} dt$$

rect function

sinc function

2D Fourier transform

$$\hat{f}(\omega_x, \omega_y) = \int_{-\infty}^{+\infty} f(x, y) e^{-j(\omega_x x + \omega_y y)} dx dy$$

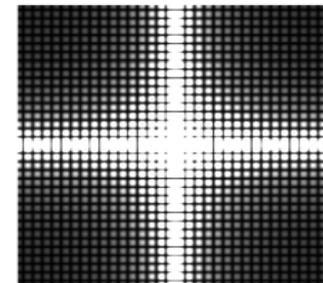

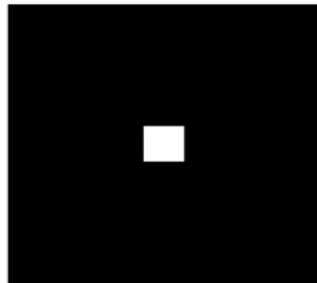

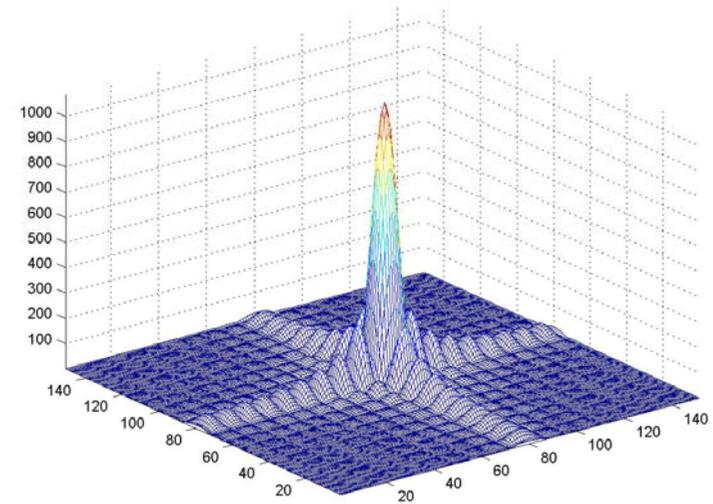

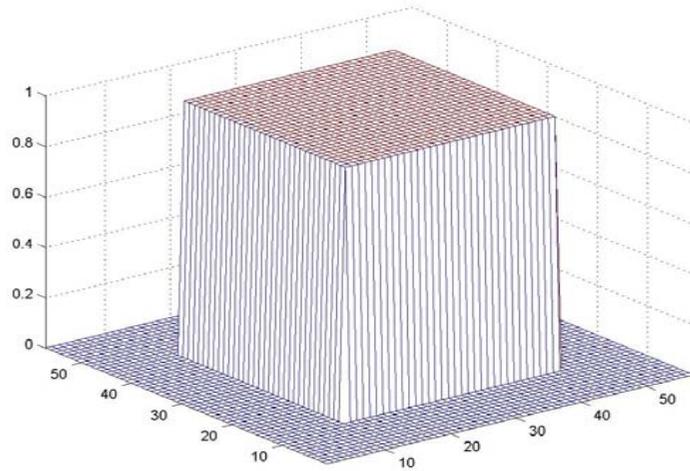

$$f(x, y) = \frac{1}{4\pi^2} \int_{-\infty}^{+\infty} \hat{f}(\omega_x, \omega_y) e^{j(\omega_x x + \omega_y y)} d\omega_x d\omega_y$$

$$\iint f(x, y) g^*(x, y) dx dy = \frac{1}{4\pi^2} \iint \hat{f}(\omega_x, \omega_y) \hat{g}^*(\omega_x, \omega_y) d\omega_x d\omega_y \quad \text{Parseval formula}$$

$$f = g \rightarrow \iint |f(x, y)|^2 dx dy = \frac{1}{4\pi^2} \iint |\hat{f}(\omega_x, \omega_y)|^2 d\omega_x d\omega_y \quad \text{Plancherel equality}$$

Wavelets & Filterbanks

Very efficient implementation by recursive filtering

Fourier versus Wavelets

Fourier

- Basis functions are sinusoids
 - More in general, complex exponentials
- Switching from signal domain t to frequency domain f
 - Either spatial or temporal
- Good localization either in time or in frequency
 - Transformed domain: Information on the sharpness of the transient but not on its position
- Good for stationary signals but unsuitable for transient phenomena

Wavelets

- Different families of basis functions are possible
 - Haar, Daubechies', biorthogonal
- Switching from the signal domain to a *multiresolution* representation
- *Good localization in time and frequency*
 - Information on *both* the *sharpness* of the transient and the *point* where it happens
- Good for any type of signal

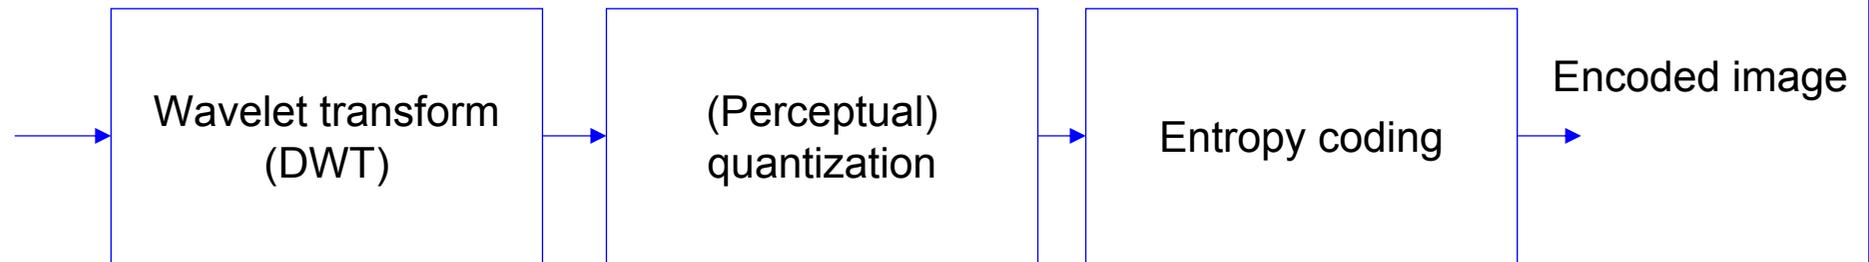

Applications

- **Compression and coding**
 - Critically sampled representations (discrete wavelet transforms, DWT)
- **Feature extraction for signal analysis**
 - Overcomplete bases (continuous wavelet transform, wavelet frames)
- **Image modeling**
 - Modeling the human visual system: Objective metrics for visual quality assessment
 - Texture synthesis
- **Image enhancement**
 - Denoising by wavelet thresholding, deblurring, hole filling
- **Image processing on manifolds**
 - Wavelet transform on the sphere: applications in diffusion MRI

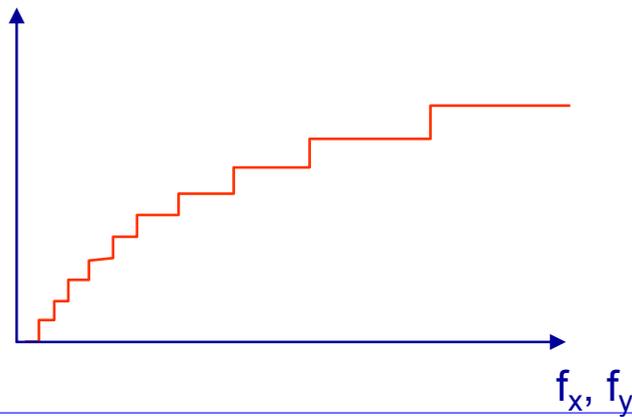

Wavelet-based coding

Original image

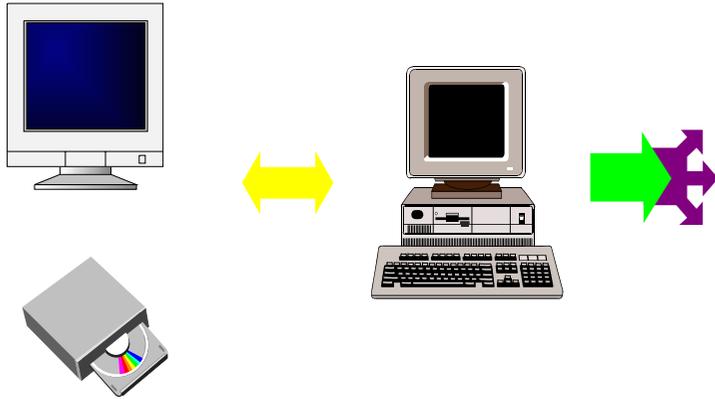

$$I_q = Q\{I\}$$

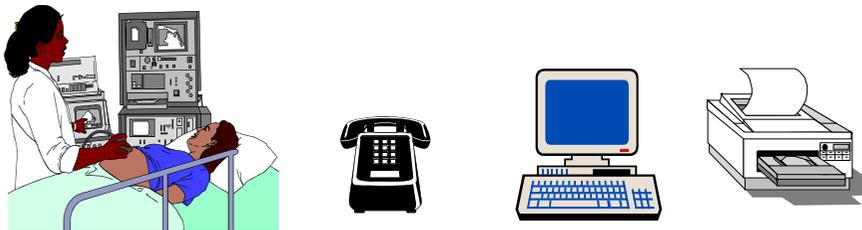

Coding standards

Desirable features:

- Flexibility
- User-data interactivity
- Openness
- Easy to use
- User interactivity
- Security

JPEG2000
