

Elaborazione di segnali e immagini per bioinformatica

Alessandro Daducci

About me

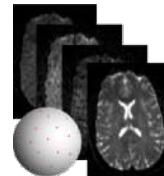

■ Background

- ▶ M.Sc. in *Computer Science* (Verona)
- ▶ Ph.D. in *Multimodal imaging in medicine* (Verona)
- ▶ Post-doc (EPFL, Switzerland + Sherbrooke, Canada)
- ▶ Assistant professor (Verona)

■ Research interests

- ▶ Diffusion MRI acquisition and reconstruction
- ▶ Fiber-tracking using convex optimization
- ▶ Applications to clinical studies

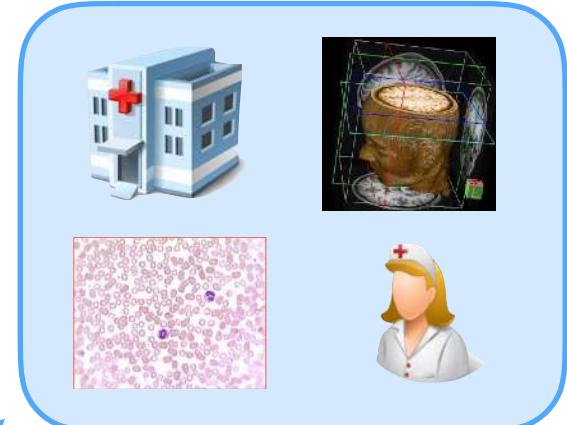

■ Contact

- ▶ alessandro.daducci@univr.it
- ▶ Office hours: enquiry by email

About the course

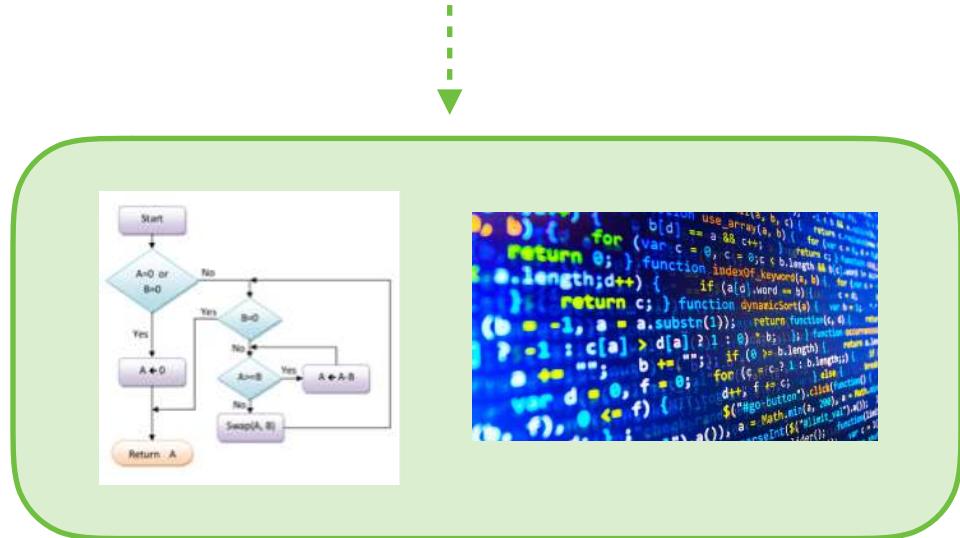

(1/3)

Image

Processing

(for bioinformatics)

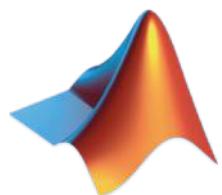

■ Modules

- ▶ Introduction and basic concepts
 - What is a digital image and how we can “process” it
- ▶ Image enhancement and restoration
 - How to improve the quality of an image
- ▶ Detecting simple curves
 - How to detect simple objects in an image, e.g. a line
- ▶ Image segmentation and registration
 - How to partition an image into different regions, e.g. background vs foreground
 - How to align different images
- ▶ Image compression
 - e.g. algorithms behind GIF, PNG, JPEG file formats

■ Laboratory

- ▶ *Hands-on sessions* to play with the tools we see in the theory sessions
- ▶ Use state-of-the-art software
- ▶ *Implement* some of these algorithms (in MATLAB)

■ Exam

- ▶ Practical exercises in the lab
- ▶ Written test about the course topics

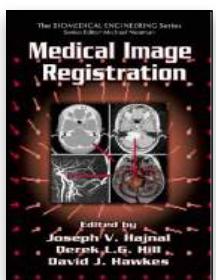

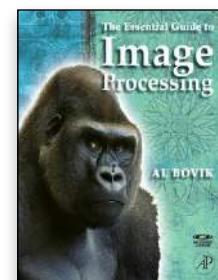

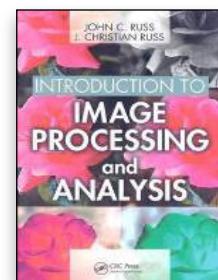

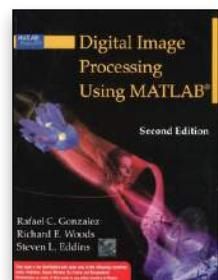

■ Classes schedule

- ▶ Breaks?
- ▶ Public holidays?
- ▶ Theory and lab sessions

| | | | |
|-----------|---------------|------------------|-----------|
| Tuesday | 10:30 - 12:30 | Lecture | Aula E |
| Wednesday | 10:30 - 13:30 | Hands-on session | Lab Delta |
| Thursday | 10:30 - 12:30 | Lecture | Aula C |

■ Credits (sources of inspiration for this course)

- ▶ Reference books
- ▶ Courses
 - Prof. Tom Fletcher - University of Utah, USA
- ▶ Other
 - Google images, Wikipedia and many other websites

**What is
image processing?**

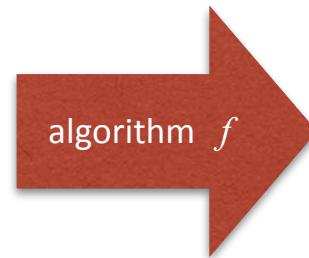

What is image processing?

(1/4)

- Image processing is the study of any algorithm that takes an **image as input** and returns an **image as output**

I

$J = f(I)$

- Example: **enhancement**

Input image : I

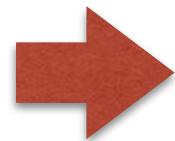

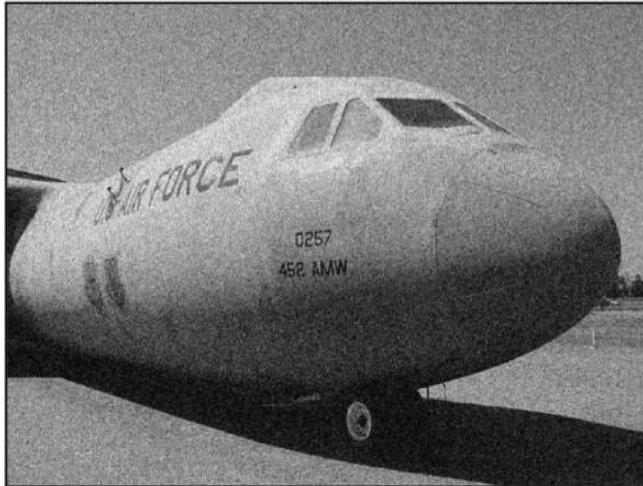

Output image : J

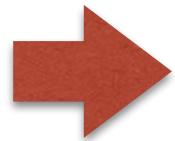

What is image processing?

(2/4)

■ Example: noise removal

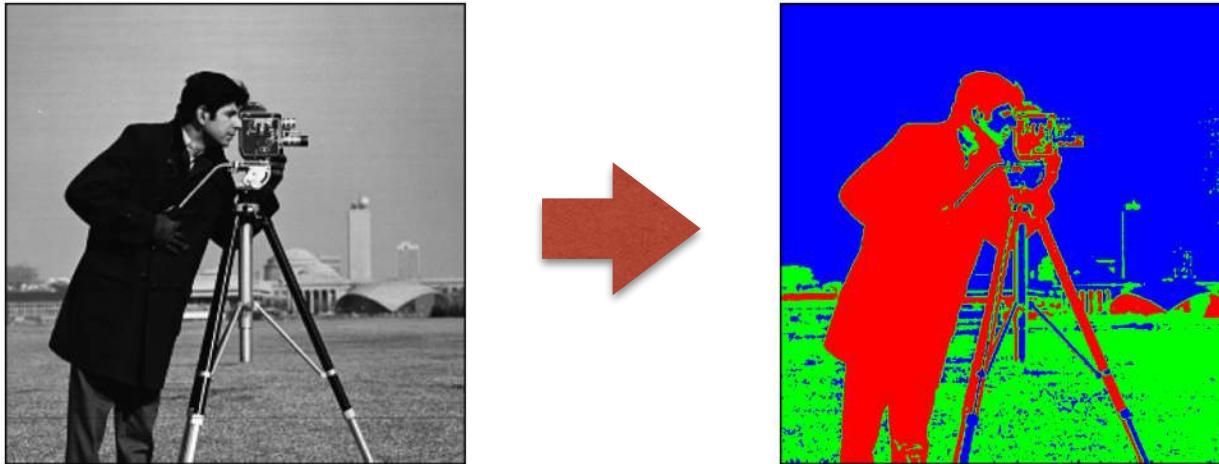

■ Example: feature detection

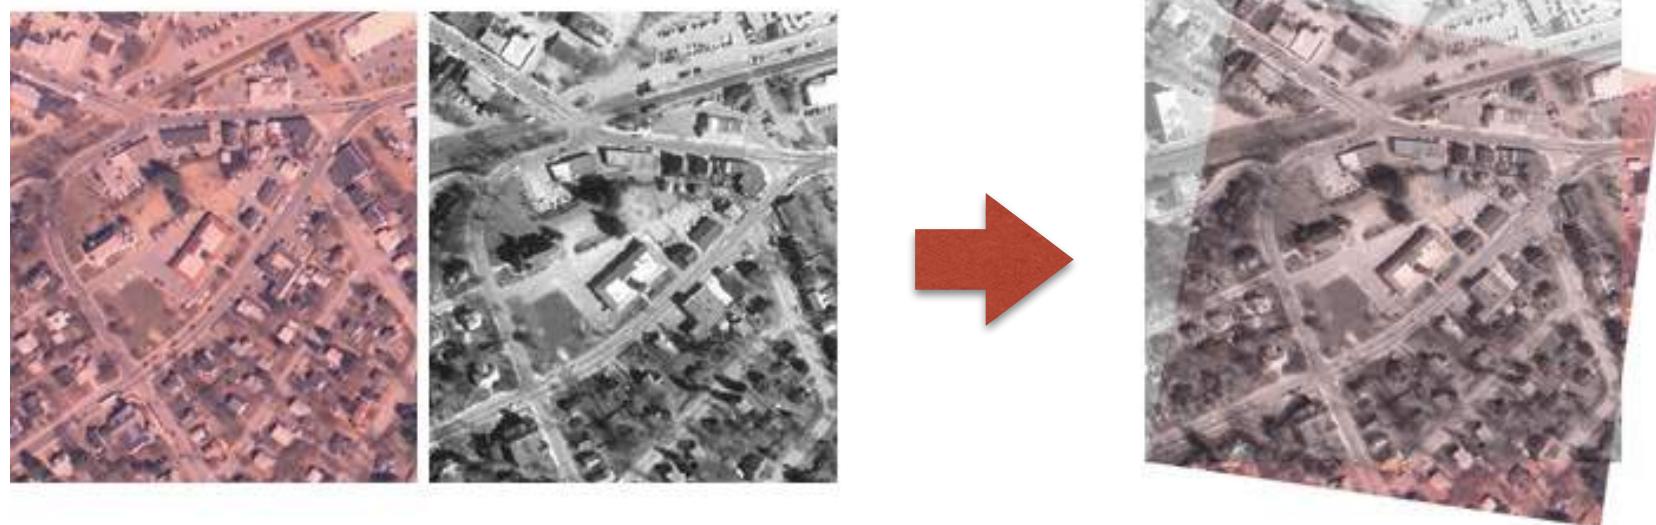

What is image processing?

(3/4)

■ Example: segmentation

■ Example: registration

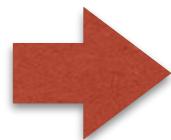

What is image processing?

(4/4)

■ Example: restoration

Damaged

Restored

■ Example: compression

Original (1.9MB)

Compressed (230 KB, 12%)

Compressed (126 KB, 7%)

Relationship to other fields

■ Image Processing

- ▶ Image enhancement, noise removal, feature detection ...

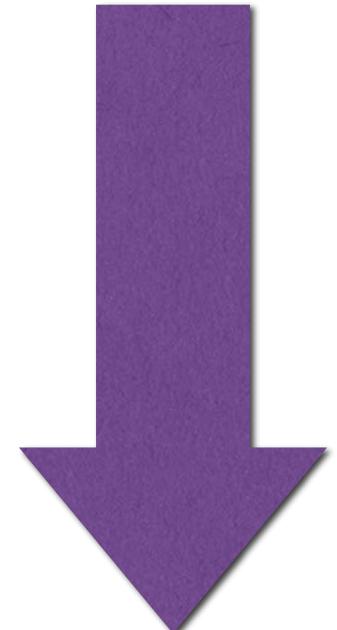

LOW level

■ Image Analysis

- ▶ Segmentation, image registration, matching ...
- ▶ Extract information, make a medical diagnosis ...

■ Computer Vision

- ▶ Object detection/recognition, shape analysis, tracking
- ▶ Use of Artificial Intelligence and Machine Learning

HIGH level

■ NB: Computer Graphics

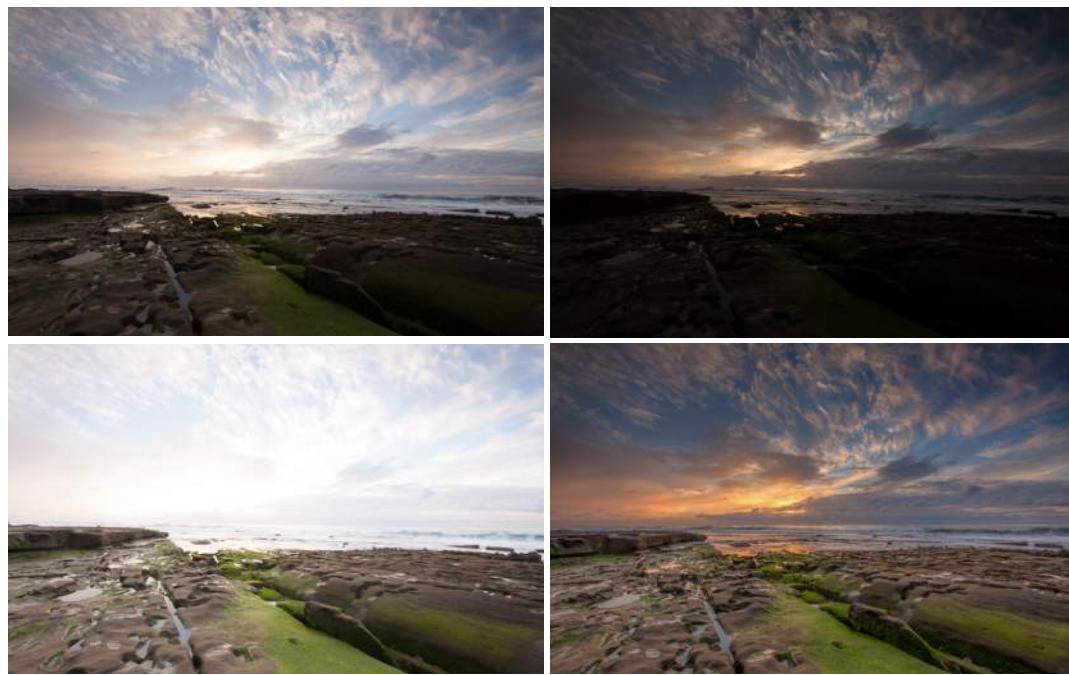

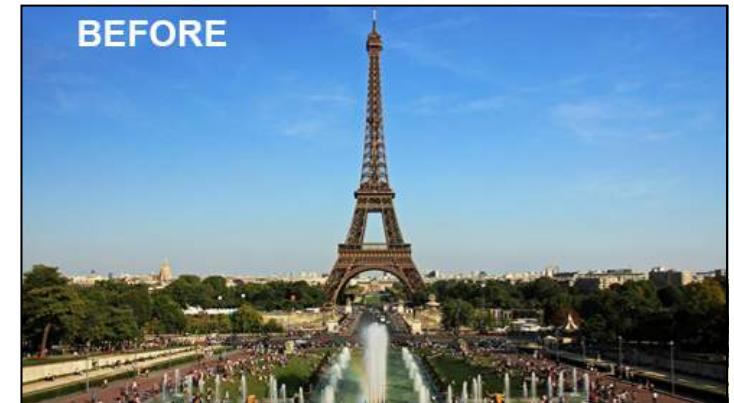

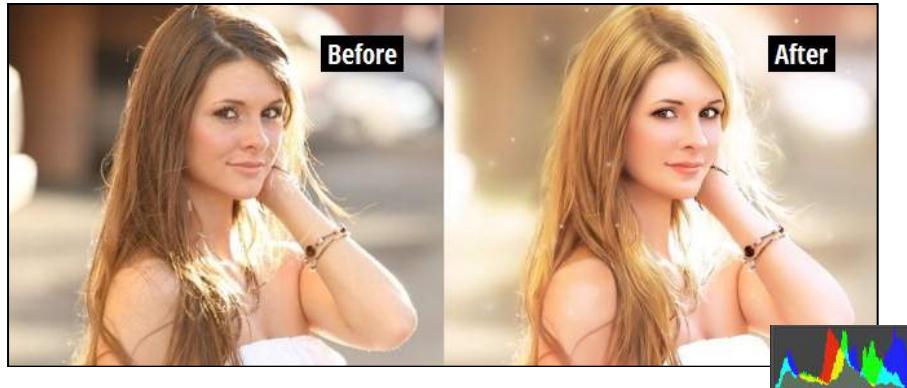

- ▶ Deals with the **synthesis and visualization of images** from a model/representation

Applications of image processing

(1/3)

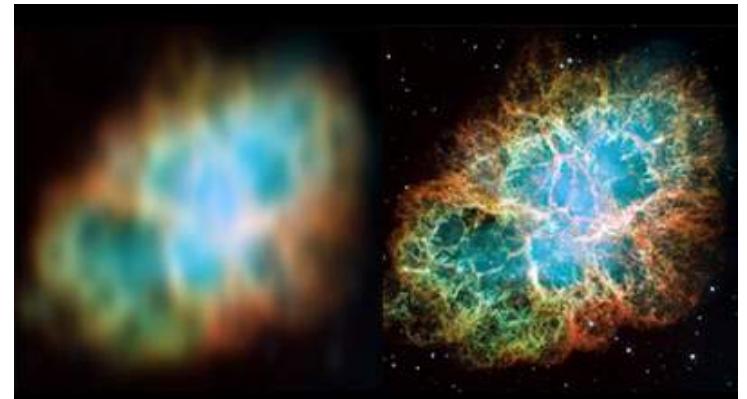

■ Photography

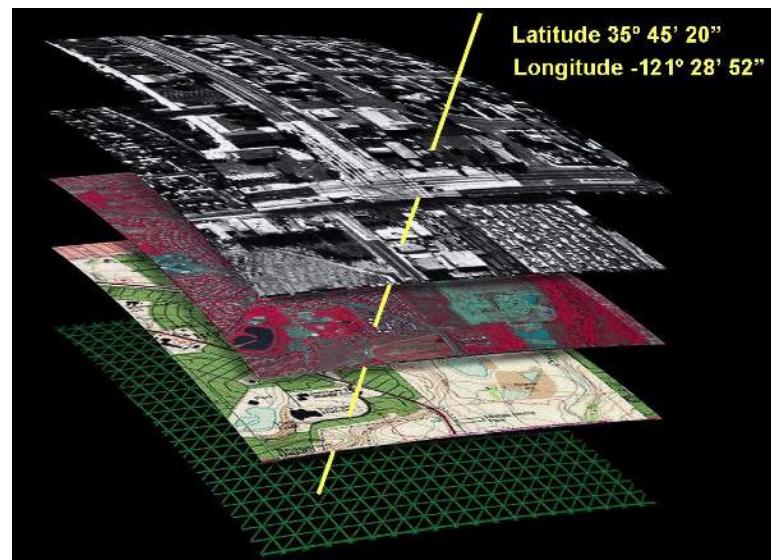

Applications of image processing

(2/3)

■ Astronomy

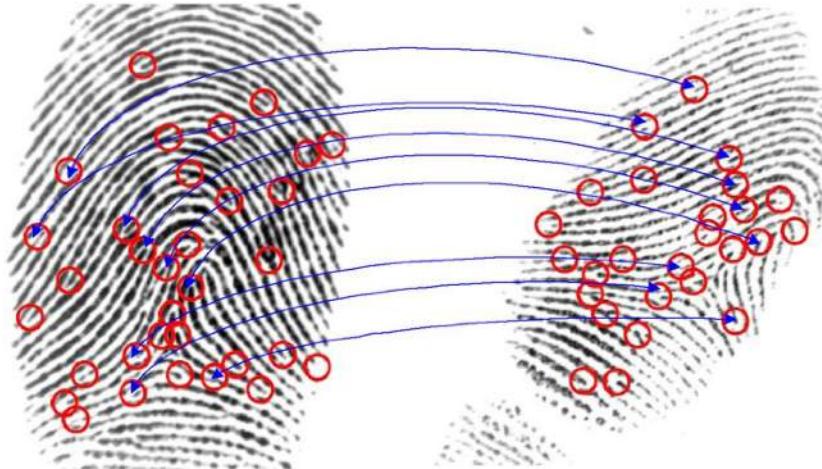

■ Satellite images

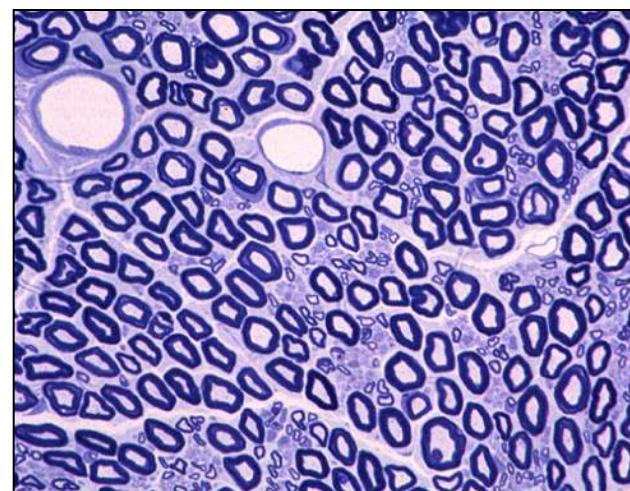

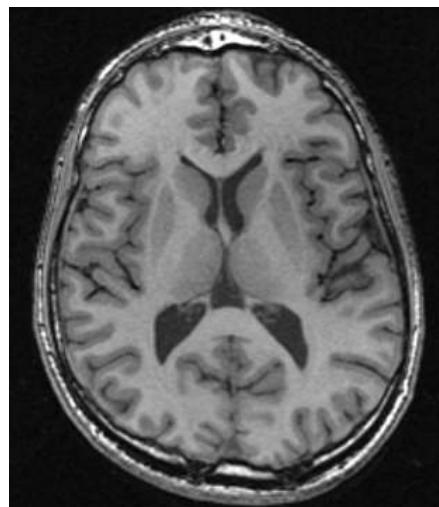

Applications of image processing

(3/3)

■ Security

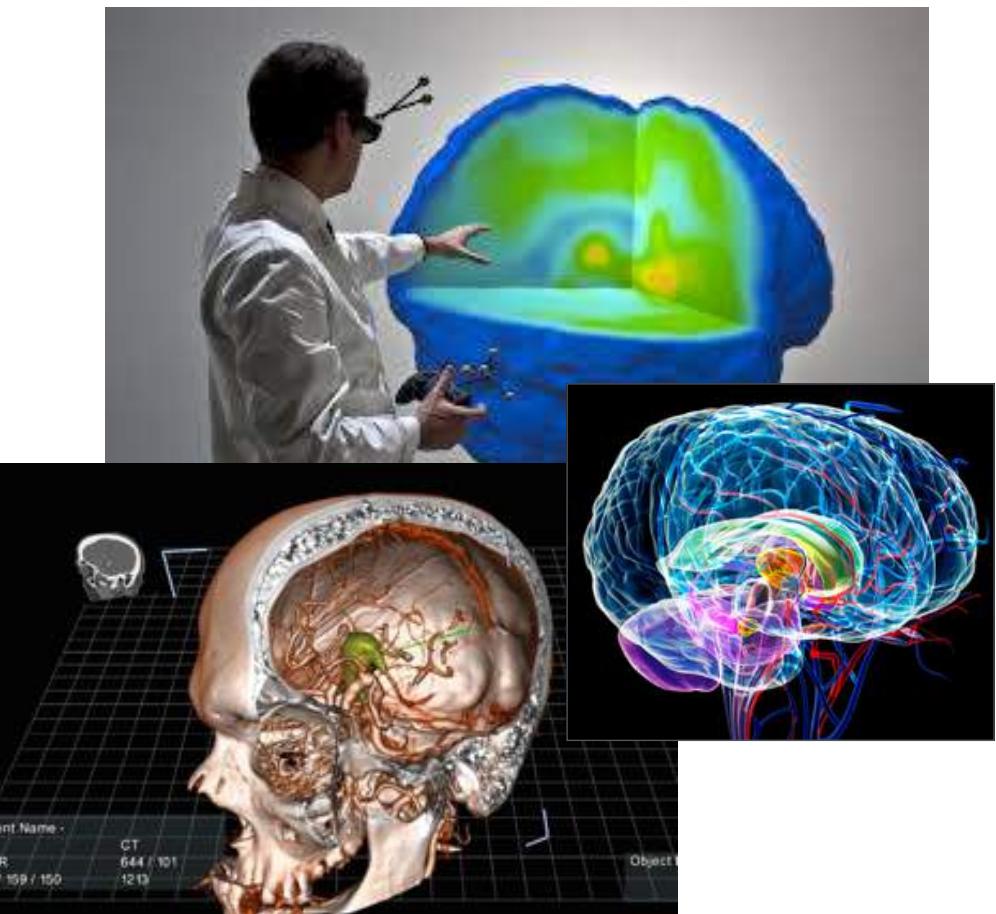

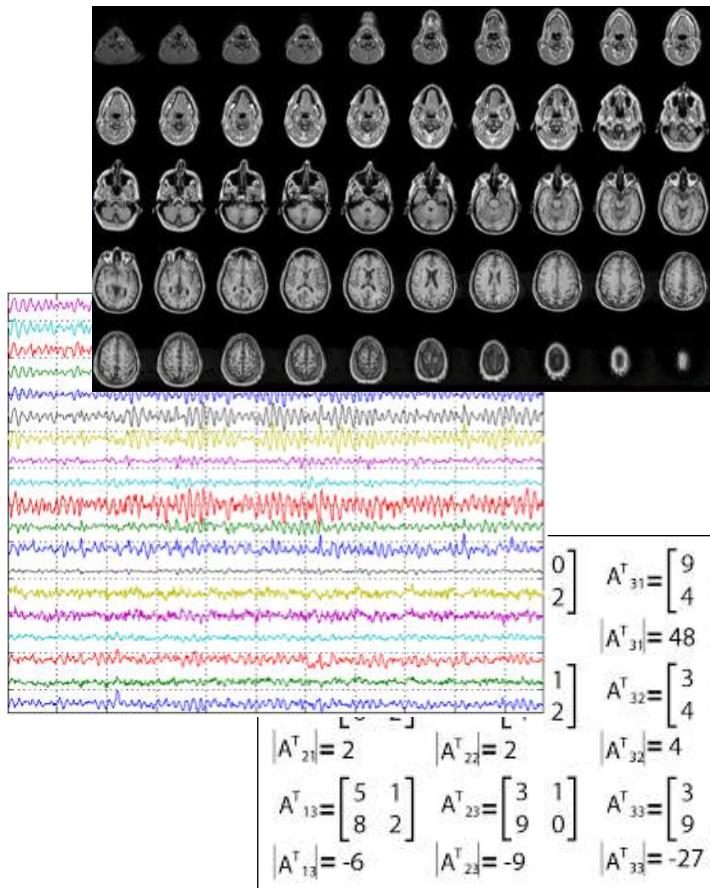

■ Medicine and biology

Why do we need image processing? (1/6)

■ Visualization

- ▶ Not for the fun of creating beautiful images...
- ▶ ...but to provide information in a form usable by doctors

Why do we need image processing?

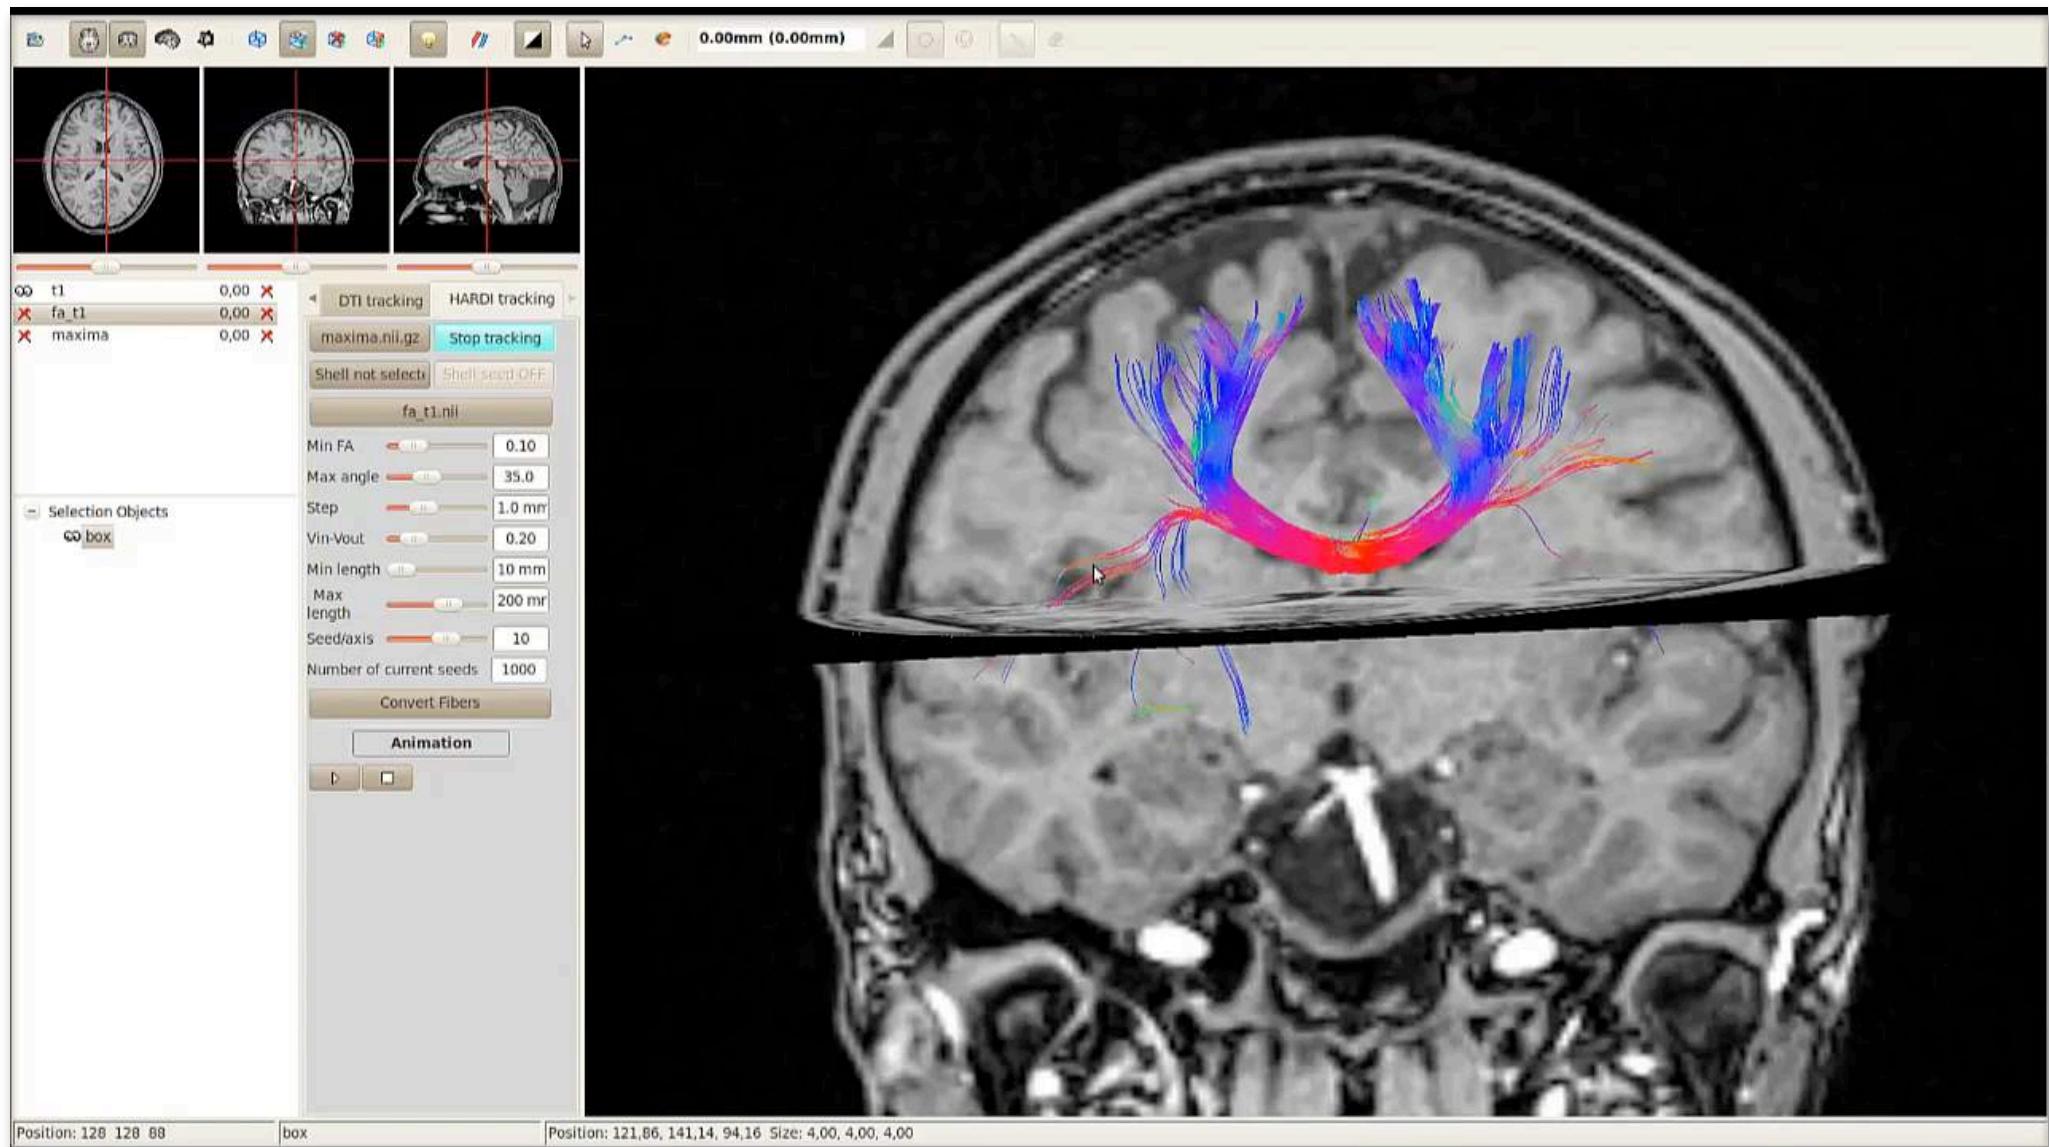

(1/6)

[video from Matthew Rowe]

Why do we need image processing?

(1/6)

[video from Maxime Chamberland]

Why do we need image processing?

(1/6)

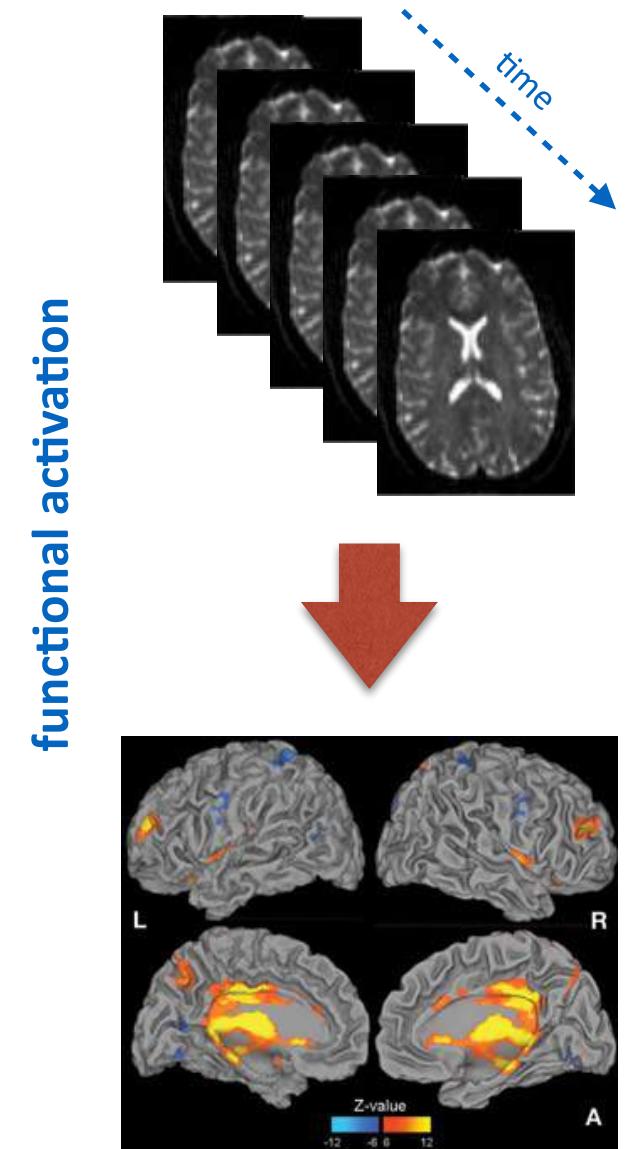

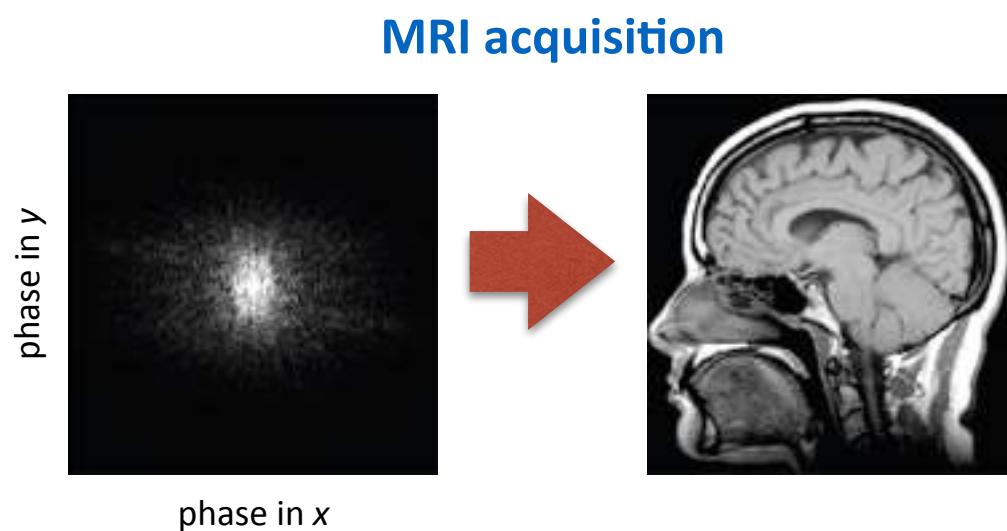

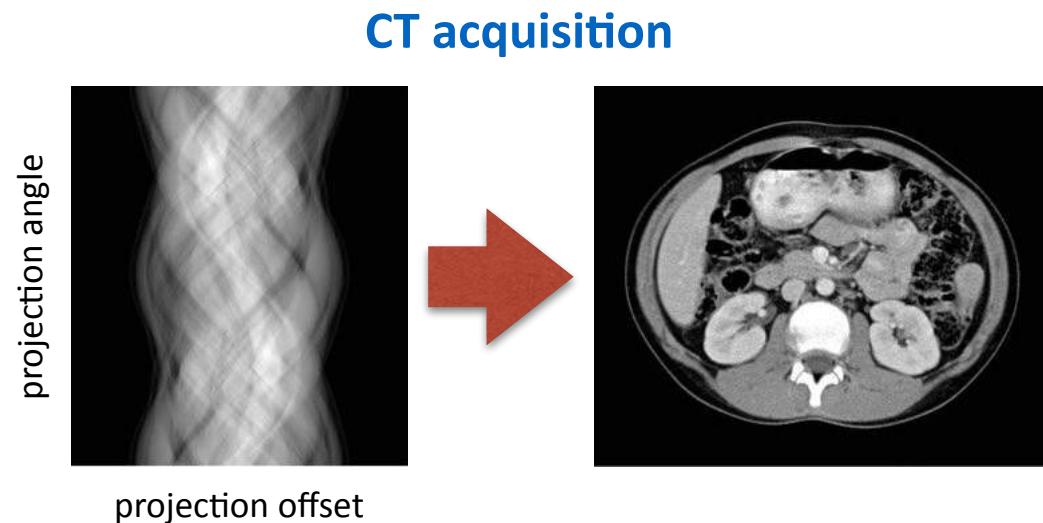

[video from Maxime Descoteaux]

Why do we need image processing?

(2/6)

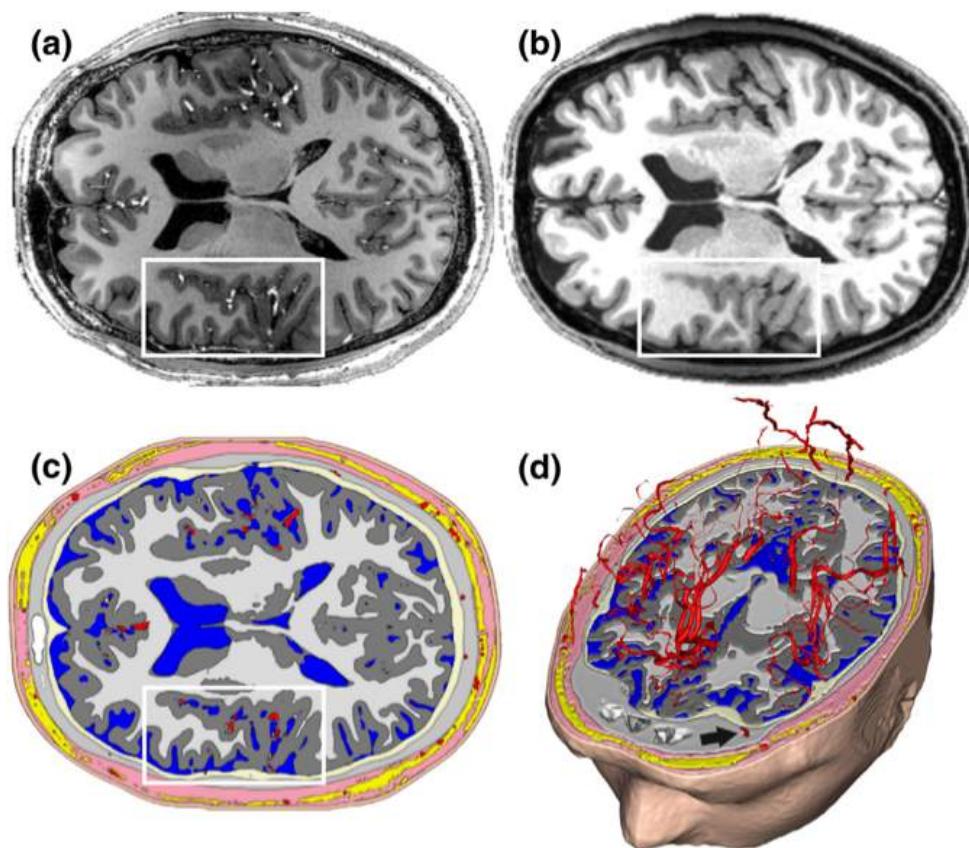

■ Reconstruction

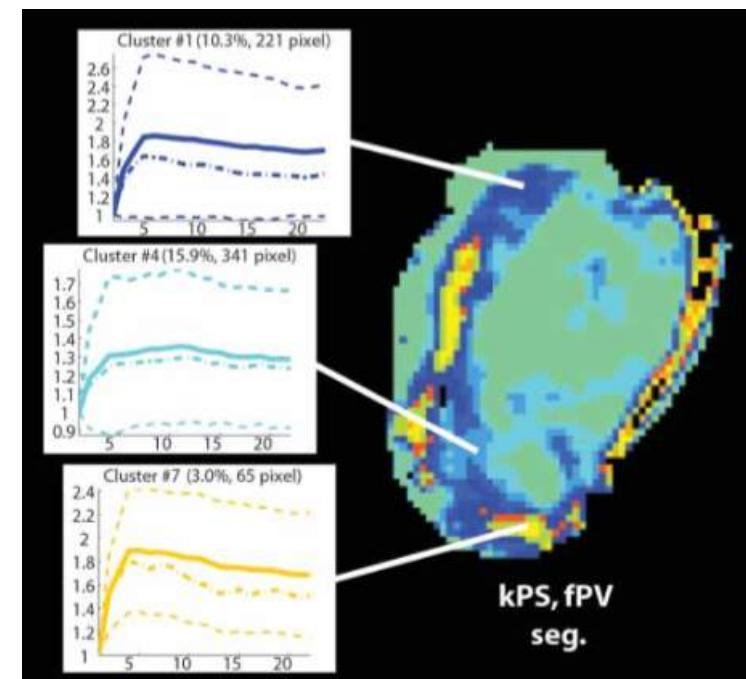

Why do we need image processing? (3/6)

■ Segmentation

Quantify/study different tissues

Detect tissue abnormalities

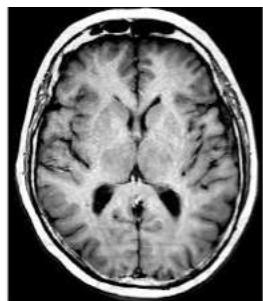

Why do we need image processing?

(4/6)

■ Registration

Compare different subjects

subject 1

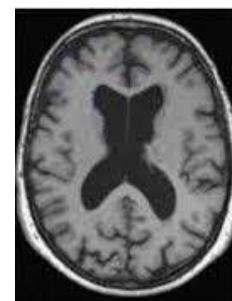

subject 2

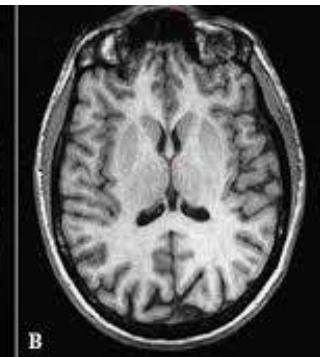

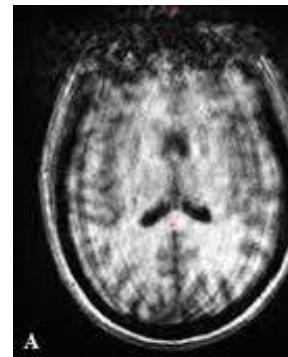

.....

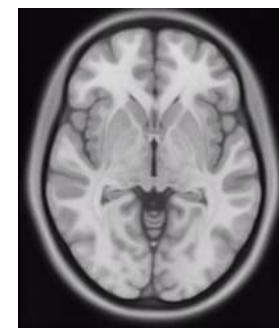

subject N

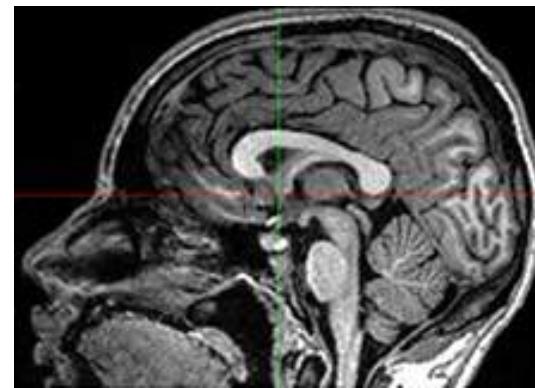

Subject motion

Detect changes in longitudinal studies

common template

first scan

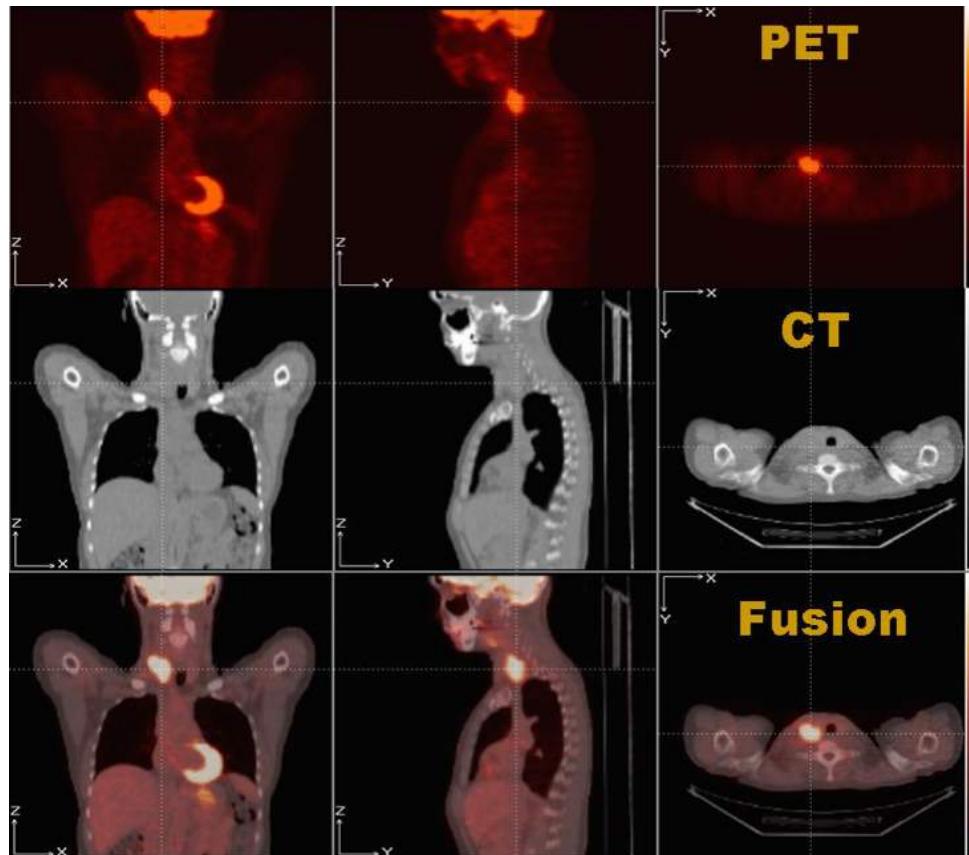

second scan

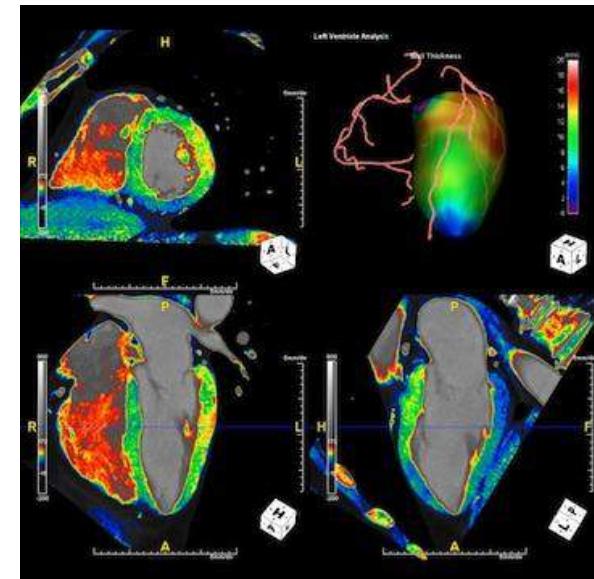

Why do we need image processing? (5/6)

■ Data fusion

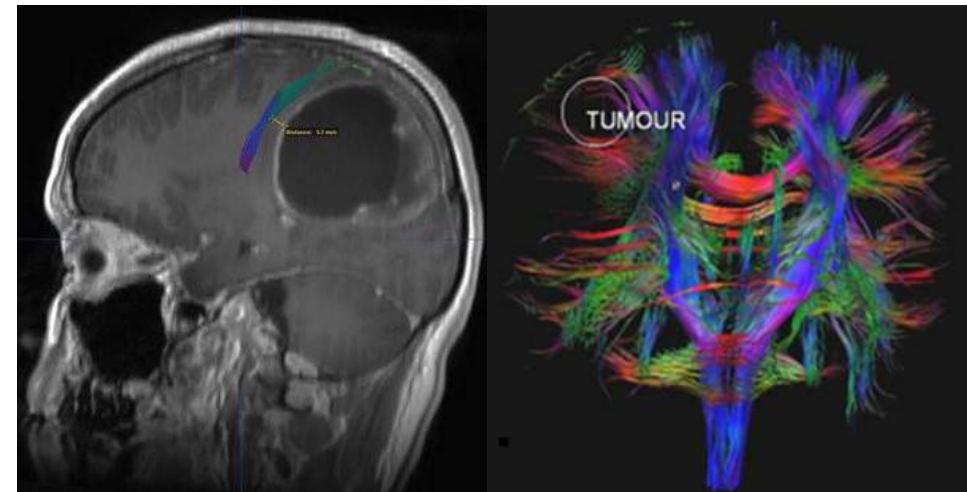

Improve accuracy

Merge different information

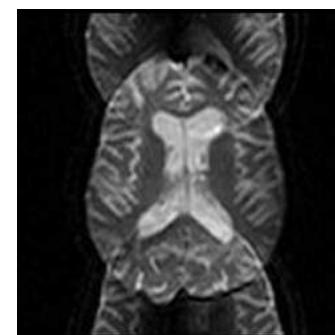

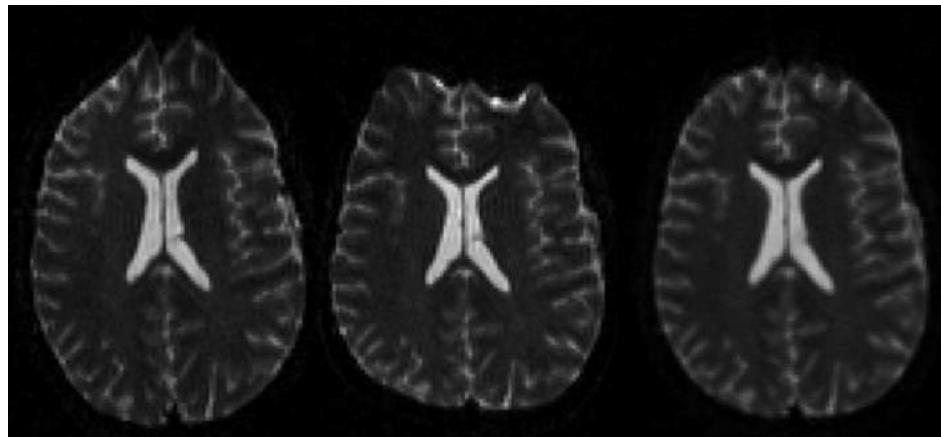

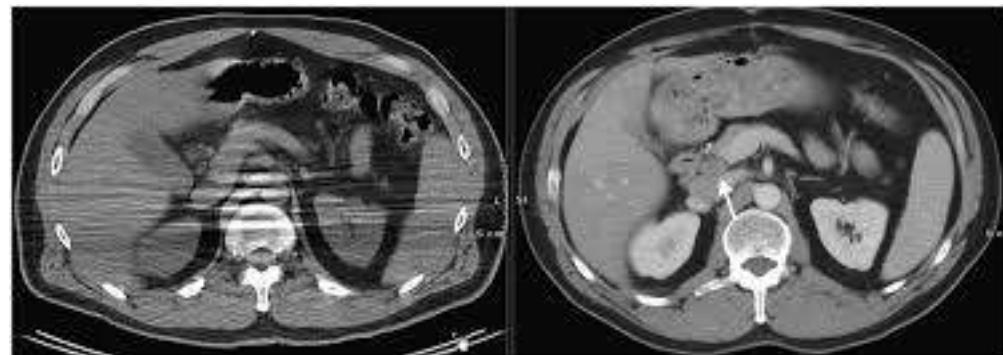

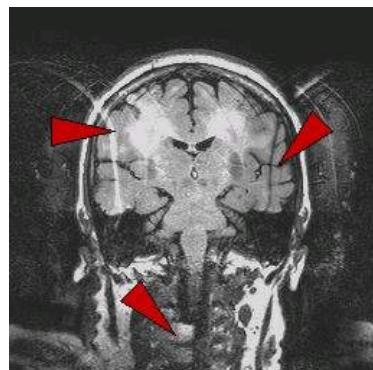

Help making decisions

Why do we need image processing?

(6/6)

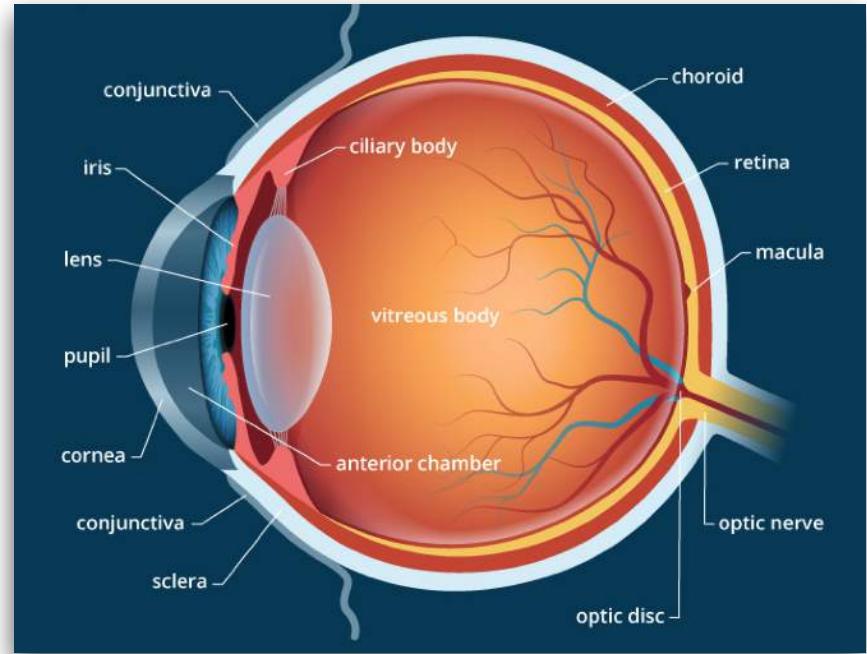

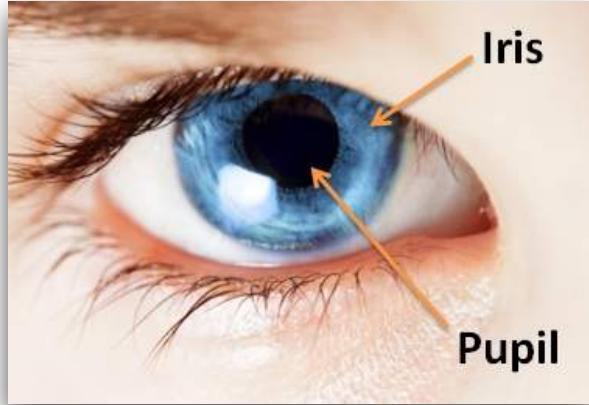

■ Artifact correction

**How can we actually
“process” an image?**

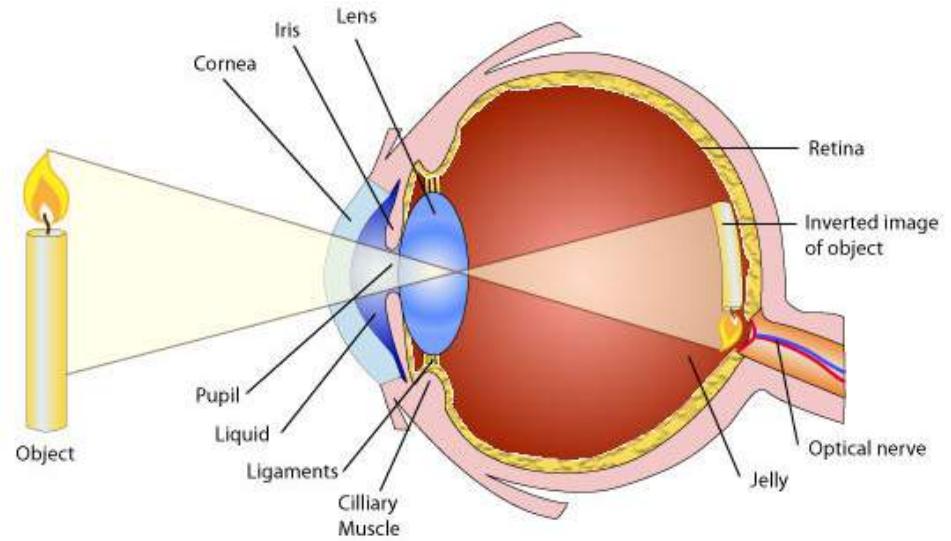

Human vision

■ Eye anatomy

■ How do we see?

- ▶ Light *enters* through the **pupil**
(changes size depending on the amount of light)
- ▶ Light is *focused* by the **lens**
- ▶ Light is *projected* (inverted) onto the **retina**, where it is collected
- ▶ Image *transmitted* to the brain through the **optic nerve**

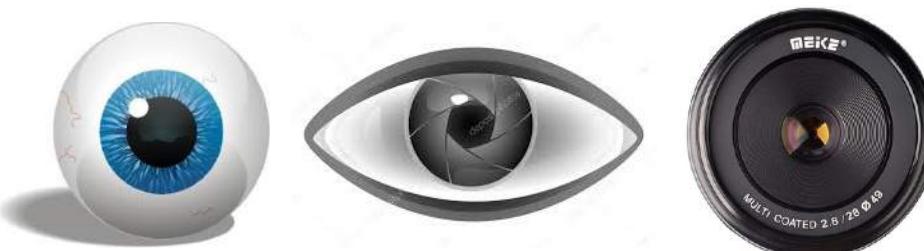

Standard (film) photography

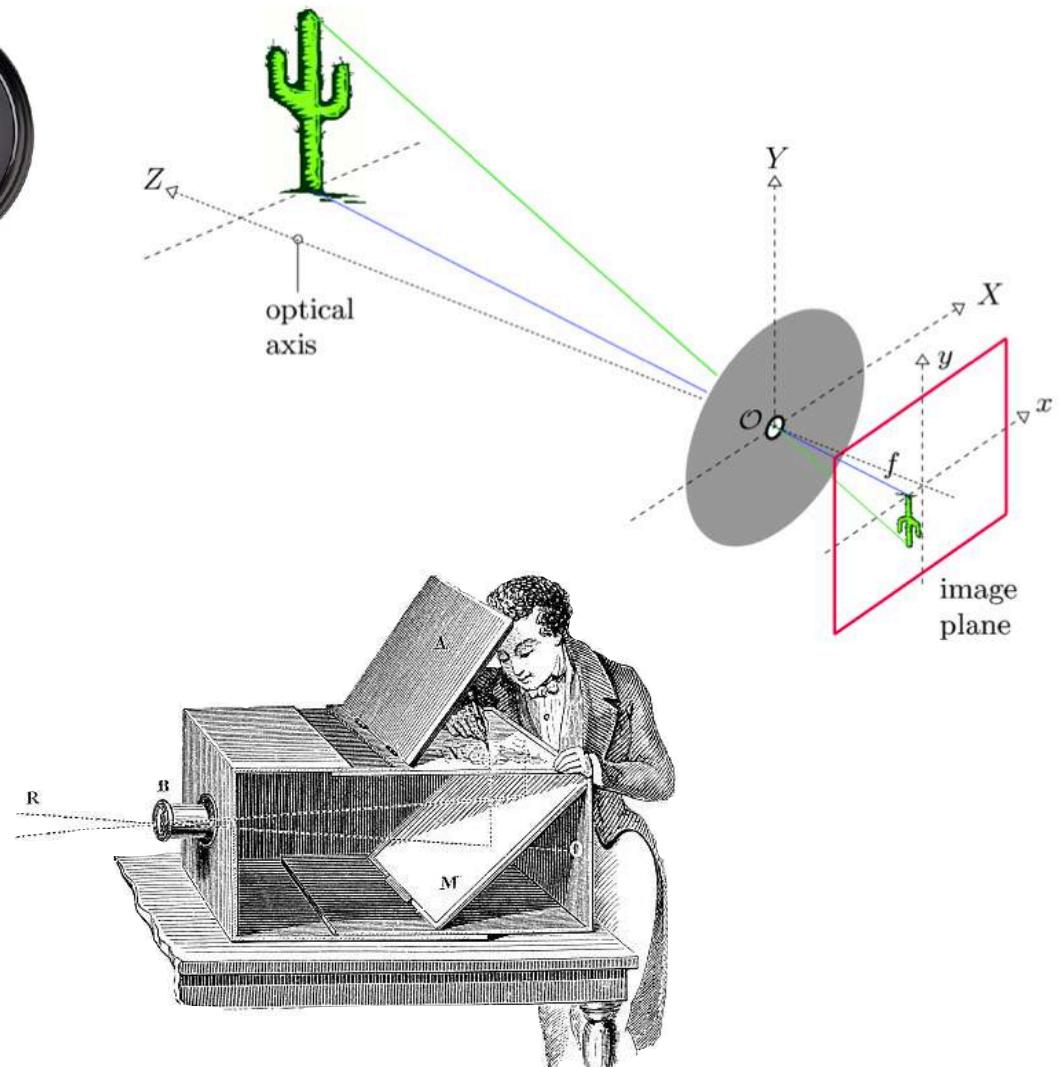

(1/2)

■ Standard photography: pinhole camera

- Simple camera *without lenses* but with a *tiny aperture*

- *Light passes through the aperture*
(can change size depending on the amount of light)
- An *image* is projected (*inverted*)
on the opposite side of a
dark room (i.e. *camera obscura*)
- A *photographic film* is impressed

Standard (film) photography

(2/2)

■ Photographic film properties

- A photograph is an **analog** and **continuous** signal

- x, y (*spatial plane*)
- z (*intensity*)

- Can resolve insanely **fine details**
- Any zoom is virtually possible

■ To convert such an image to **digital form** requires:

- Digitizing the *spatial coordinates* ➔ **sampling**
- Digitizing the *intensities/amplitudes* ➔ **quantization**

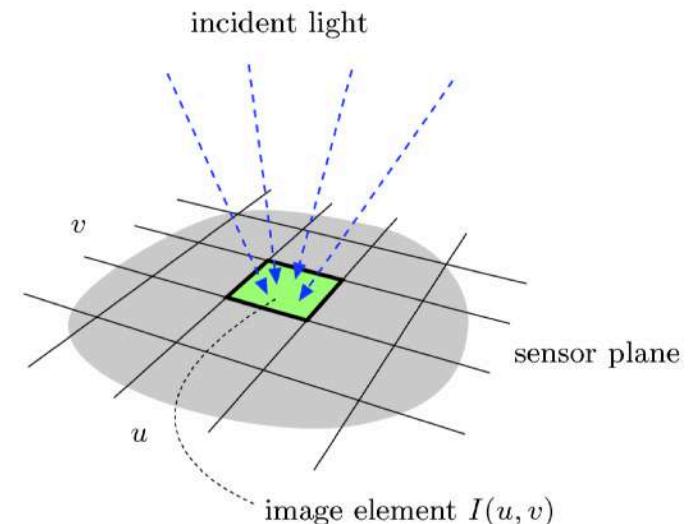

■ NB: this is an **analog to digital** conversion

- e.g. temperature is *analog*, but a **digital thermometer** reads *discrete values*

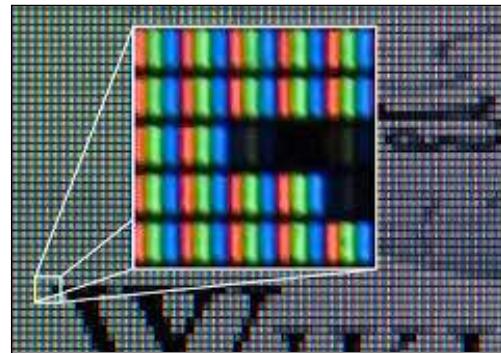

Digital photography: sampling

- ▶ A finite number of sensors arranged in a grid
- ▶ Each records the *incident light* at that position
- ▶ Each element is called **pixel**
(i.e. *picture element*)

Notes

- ▶ Each pixel actually contains *multiple sensors*

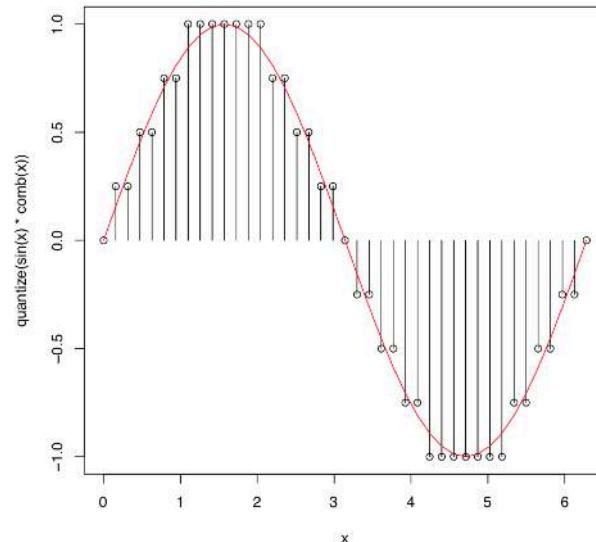

- ▶ In this course we will focus on **monochrome images** (or *grayscale*)
- ▶ Most image processing algorithms can be *extended to color images*

Digital photography

(2/4)

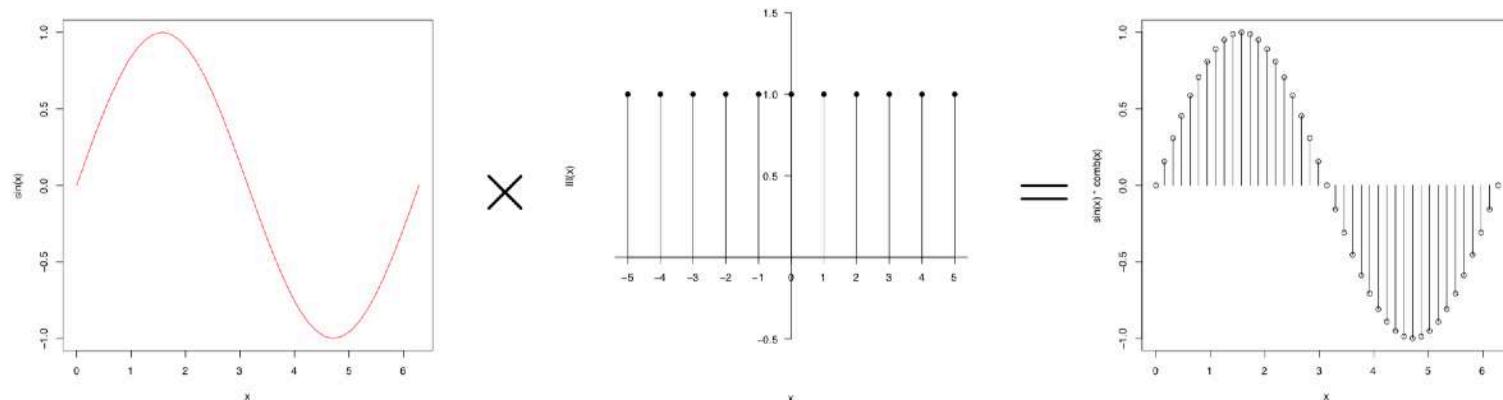

Digital photography: quantization

- To store pixels digitally, we also need to *discretize their amplitudes/intensities*

Note

- Spatial *sampling* = multiplication of a *continuous signal* with a *comb function*

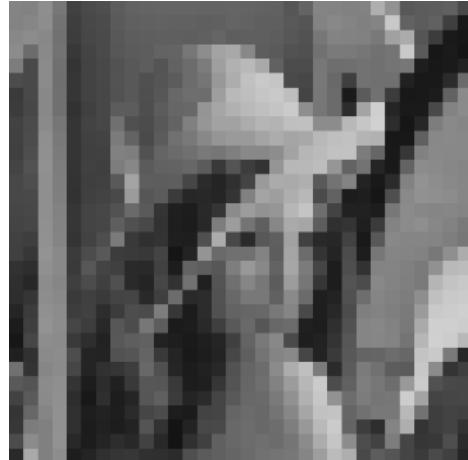

■ Effect of sampling

256x256 pixels

64x64 pixels

32x32 pixels

■ Effect of quantization

256 gray levels

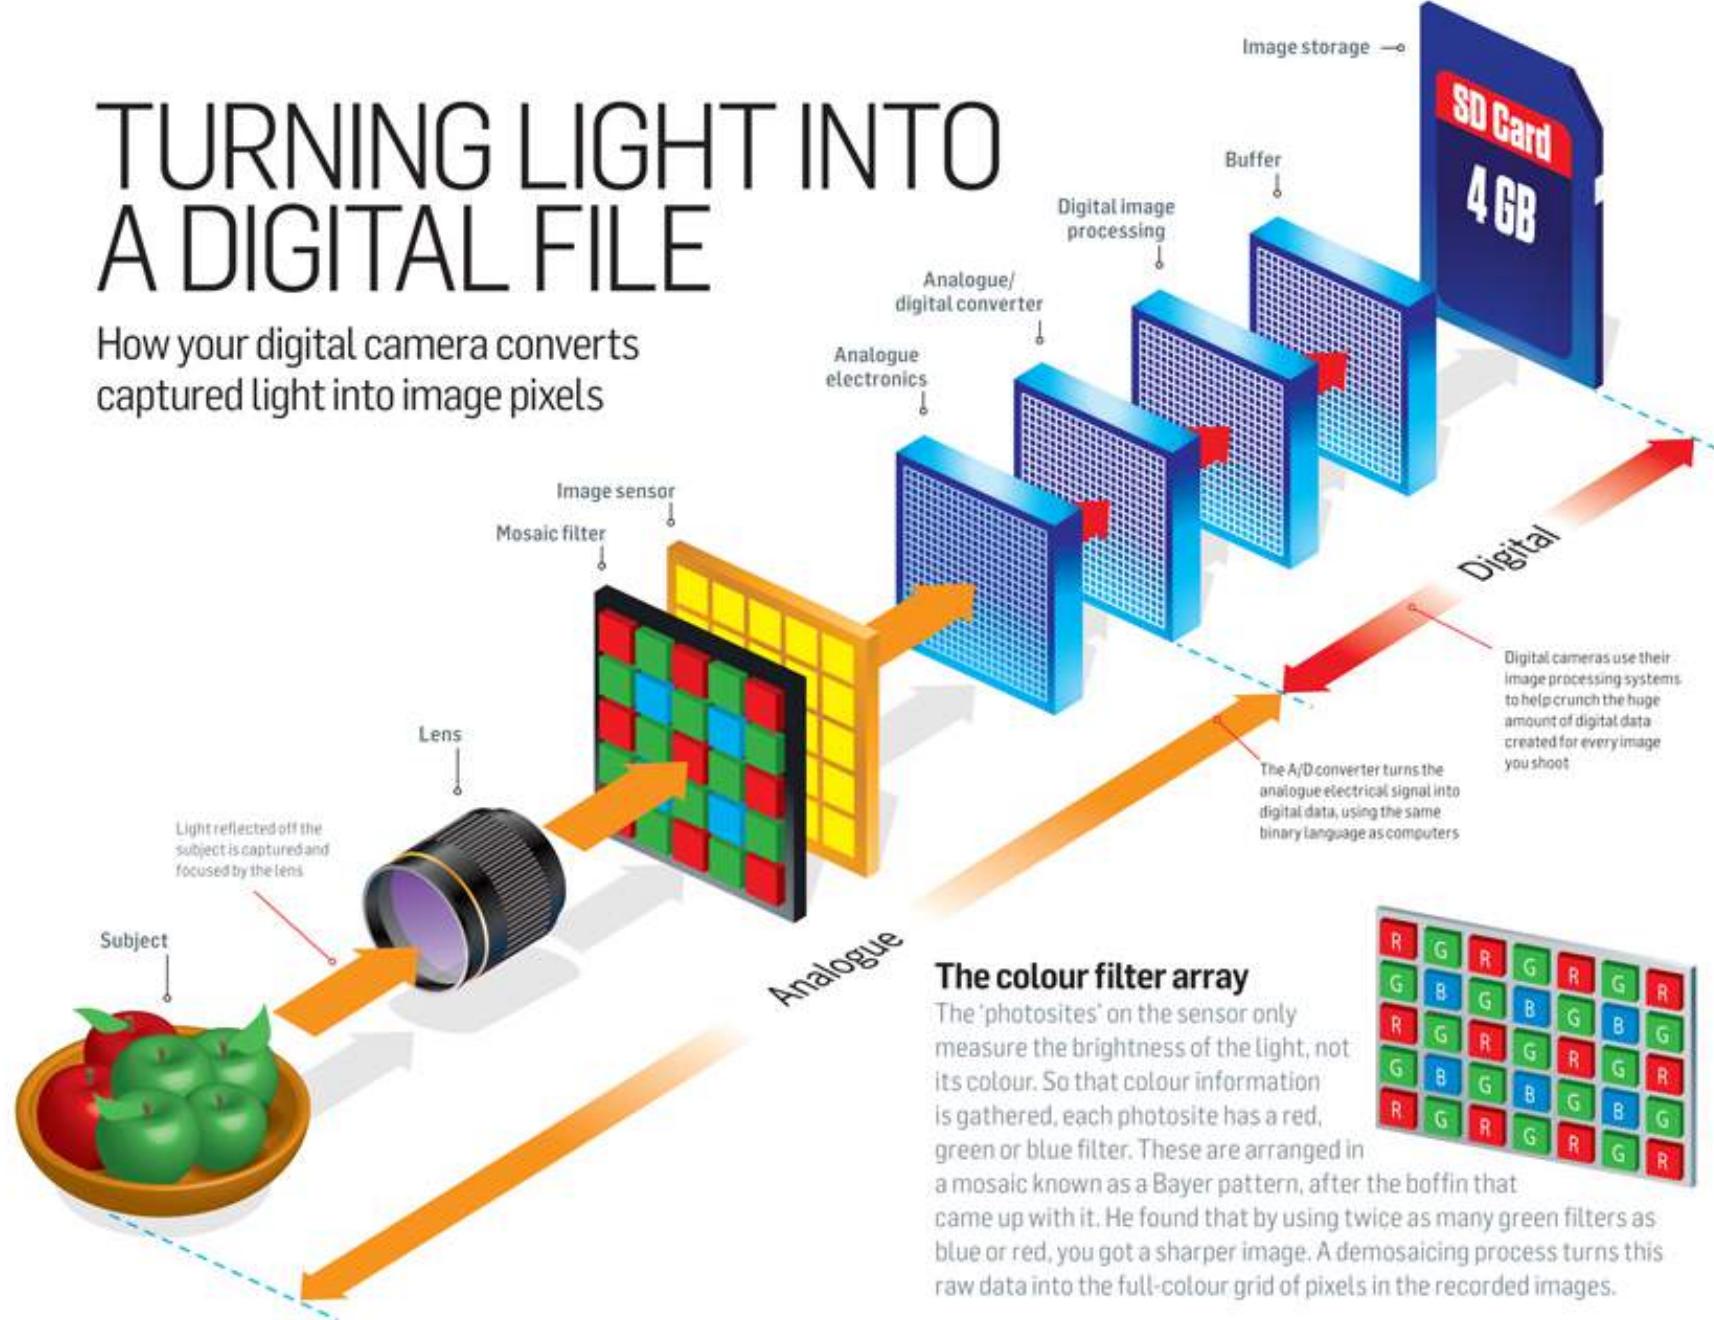

8 gray levels

4 gray levels

TURNING LIGHT INTO A DIGITAL FILE

How your digital camera converts captured light into image pixels

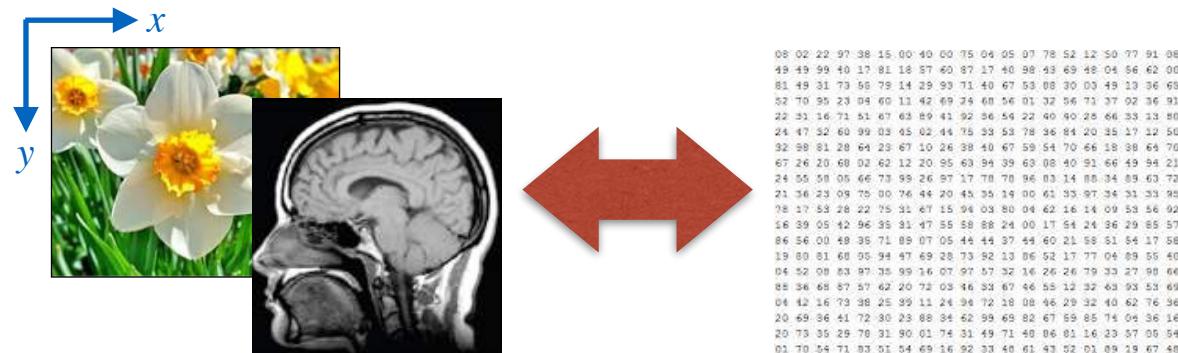

**What is a
digital image?**

What is a digital image?

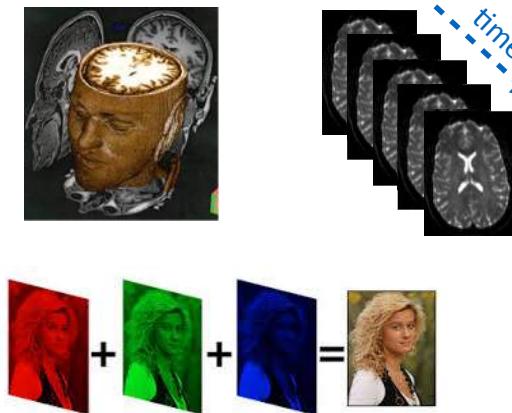

(1/4)

- The output of *sampling* and *quantization* is actually a **2D matrix of numbers**

Notes

- Coordinates not limited to 2D
- Values not limited to scalar or real values
- Pixel vs voxel
 - Pixel* = “picture element”
 - Voxel* = “volume element”

Two main representations for a digital image

- As functions
- As matrices

What is a digital image?

(2/4)

■ Representing images as **discrete functions**

- We can think of the *intensity of an image* as a function of position (u, v)
- Let $\Omega \subset \mathbb{N}^2$ be the *image domain*. Then an image is a **discrete function**:

$$I : \Omega \rightarrow \mathbb{R}$$

■ Example

A simple image

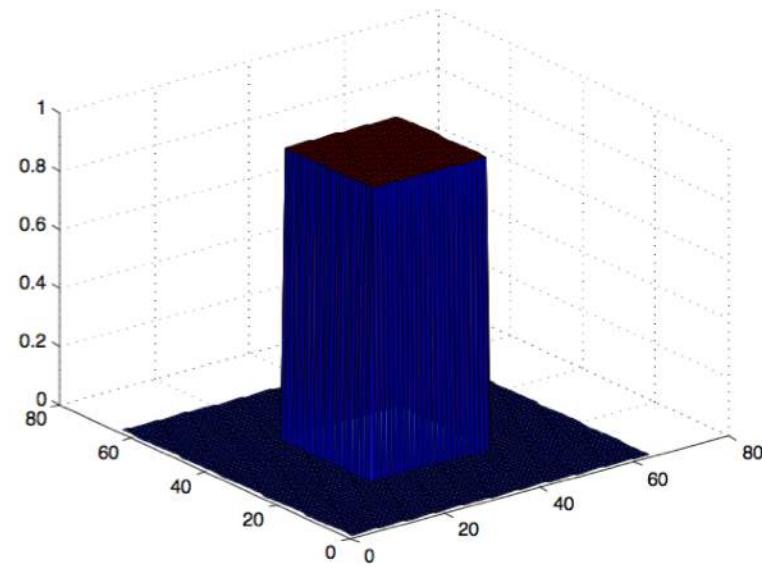

Image function as a height field

What is a digital image?

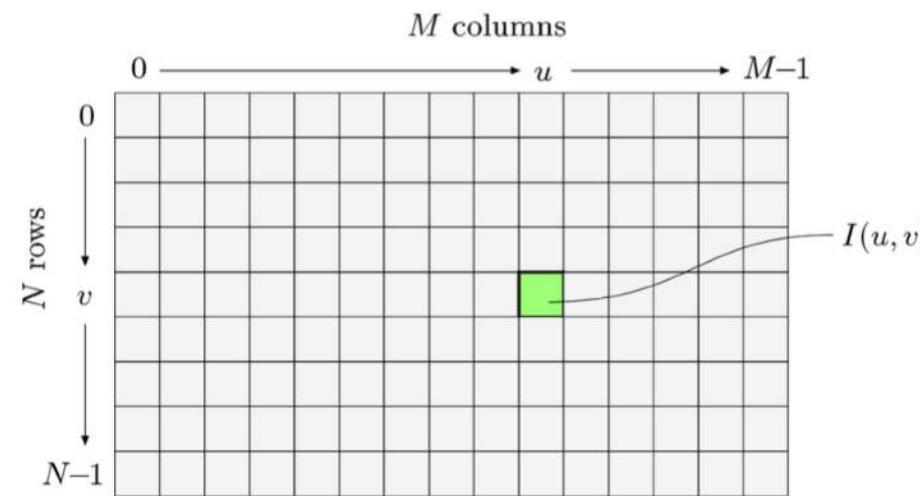

(3/4)

■ Representing images as matrices

- The *coordinates* u and v encode the spatial position (u, v)
- The number in (u, v) is the *intensity of the pixel* $I(u, v)$, i.e. $f(u, v)$

$$I(u, v) = \begin{bmatrix} f(0, 0) & f(0, 1) & \cdots & f(0, N - 1) \\ f(1, 0) & f(1, 1) & \cdots & f(1, N - 1) \\ \vdots & \vdots & & \vdots \\ f(M - 1, 0) & f(M - 1, 1) & \cdots & f(M - 1, N - 1) \end{bmatrix}$$

- The data structure is simply a **2D array of values**:

- The values in the array can be *any data type* stored in a camera/computer (8-bit, 16-bit..., signed/unsigned etc)

What is a digital image?

(4/4)

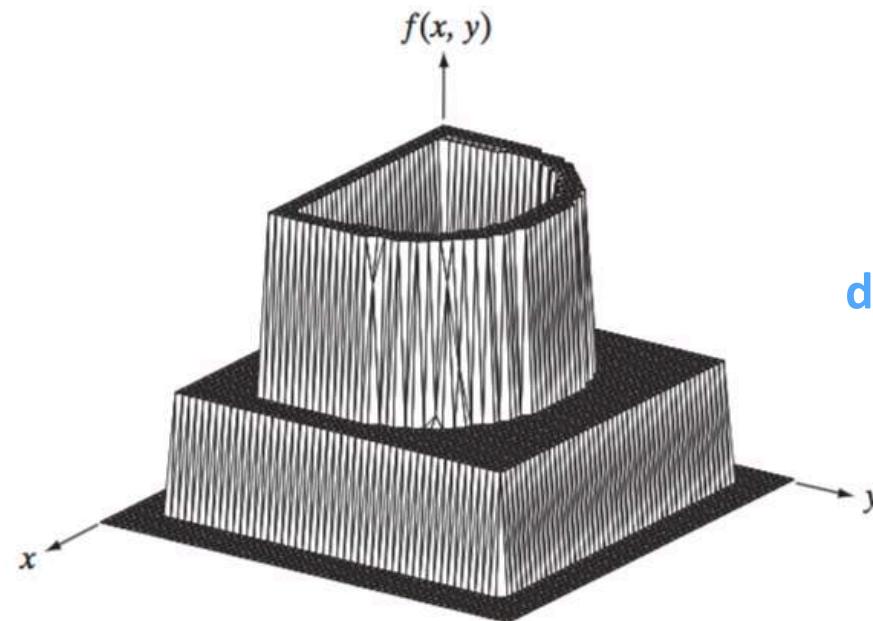

image as a
discrete function

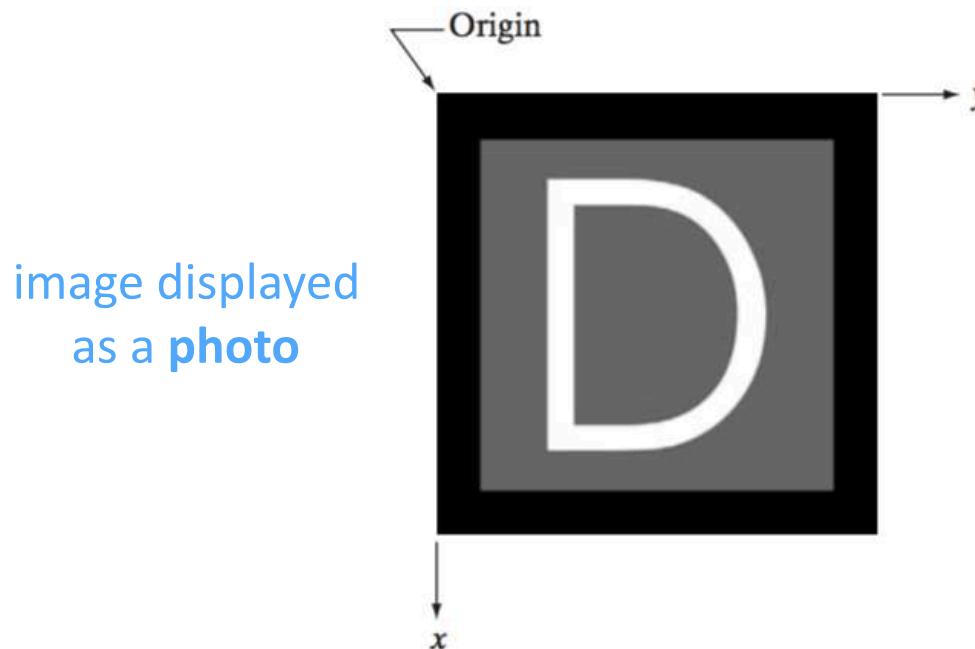

image displayed
as a photo

image as a
matrix

Digital photography vs biomedical images (1/4)

Images formed by interaction with tissues/organs

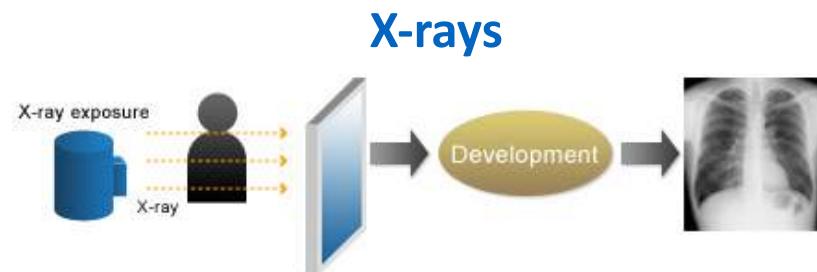

► Photography

- reflection of light

► Biomedical images

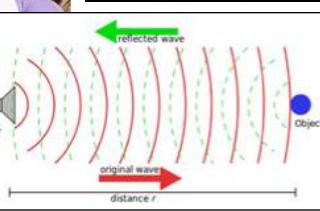

- emission and absorption of signal
- different mechanisms to provide contrast

X-rays

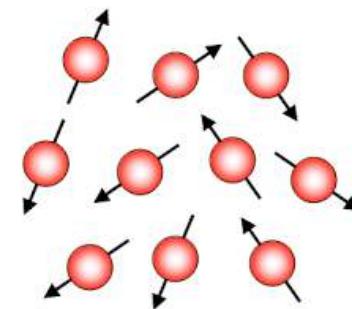

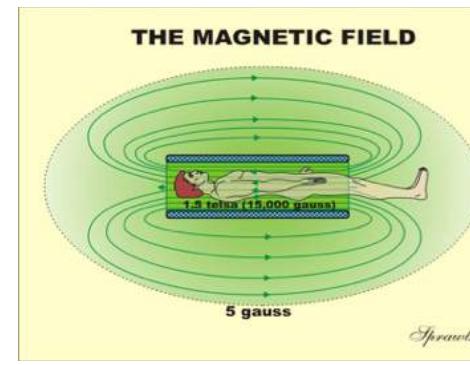

Positron Emission Tomography

The radiotracer, injected into a vein, emits gamma radiation as it decays. A gamma camera scans the radiation area and creates an image.

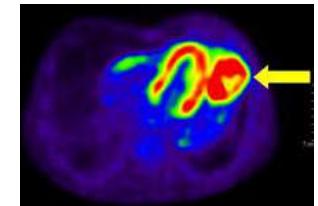

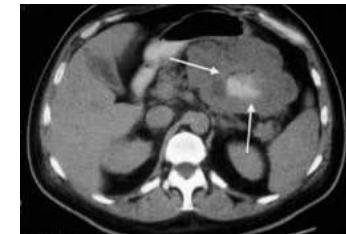

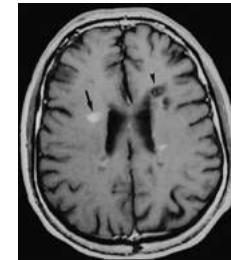

Ultrasounds

Magnetic Resonance Imaging

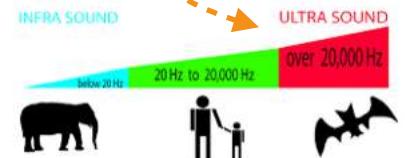

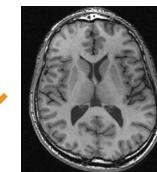

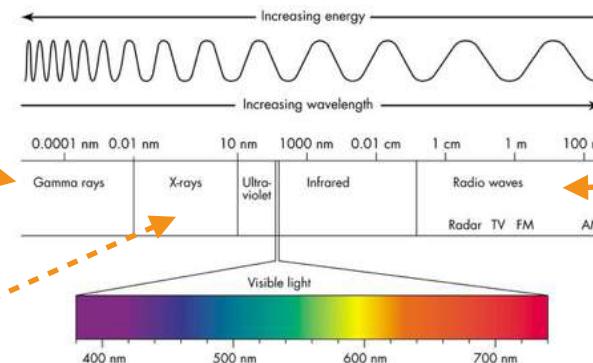

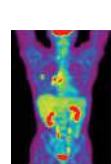

Digital photography vs biomedical images (2/4)

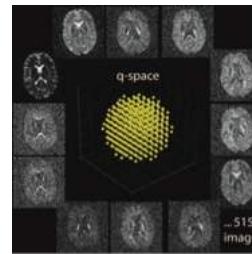

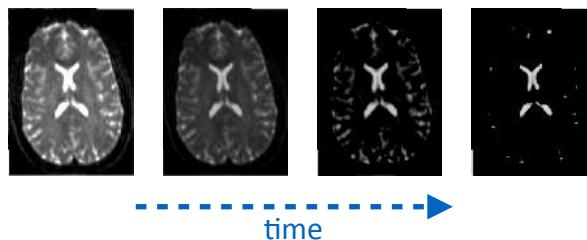

■ Represent various physical properties

■ Use electromagnetic and audio spectrums

■ Are not limited to 2D

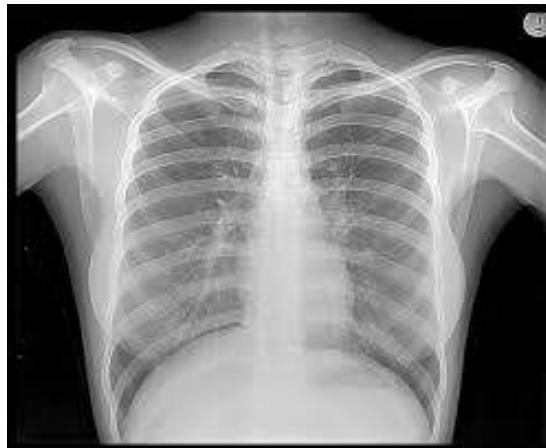

NB: diffusion MRI is a **7D modality!**

Digital photography vs biomedical images

(3/4)

■ Application: study “anatomy” or “structure”

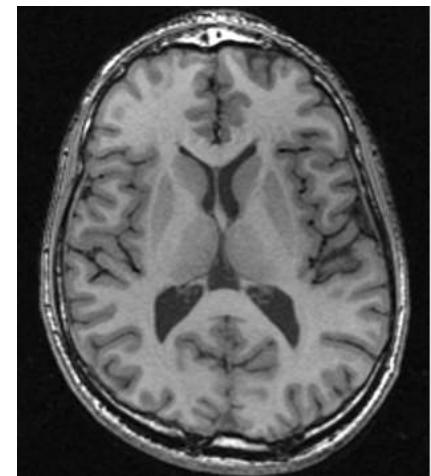

X-rays

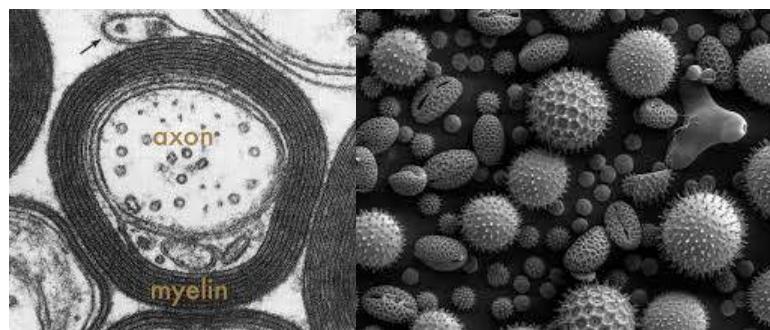

CT

MRI

electron microscopy

US

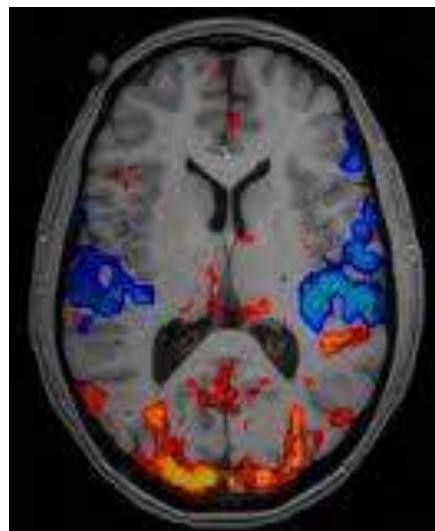

Digital photography vs biomedical images

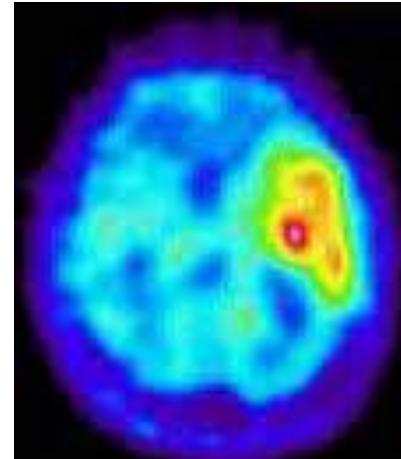

(4/4)

■ Application: study “function” or “activity”

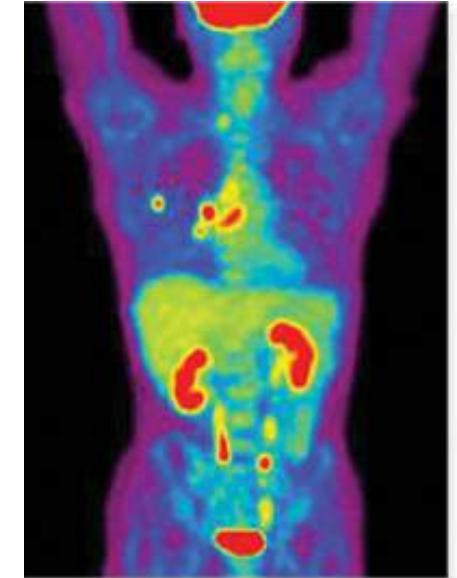

functional MRI

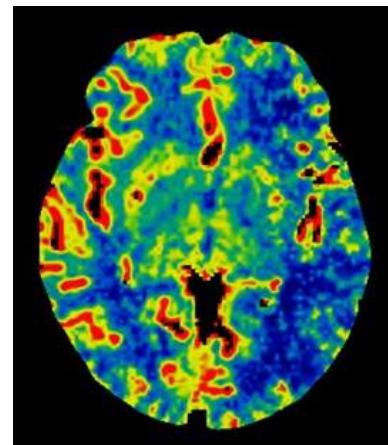

SPECT

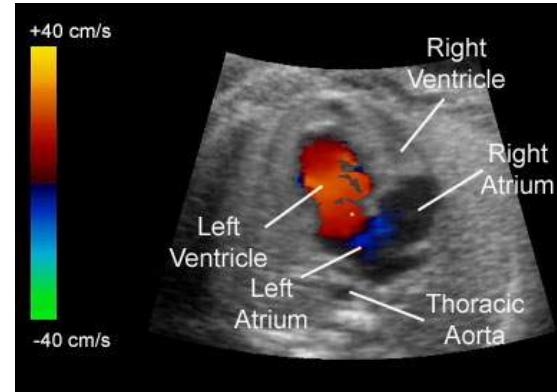

PET

perfusion CT

doppler US

Important image properties

(1/7)

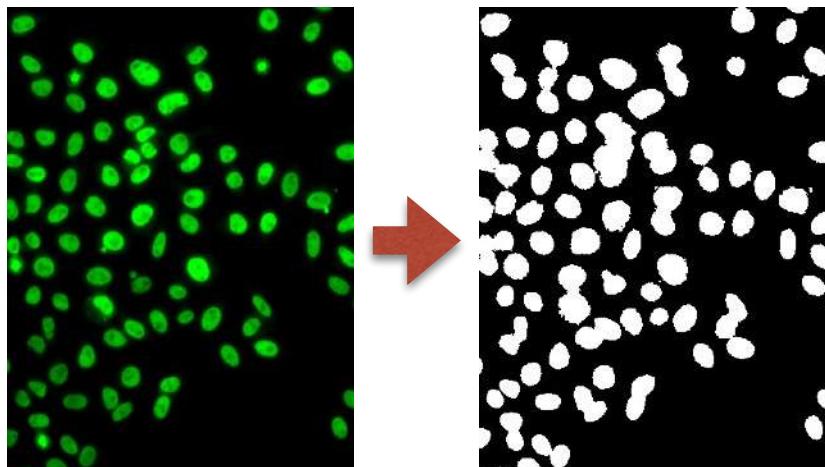

■ Metadata is required for correct interpretation

- ▶ Which parameters were used to produce the image?
- ▶ How is data stored?
- ▶ How was the patient positioned inside the scanner?
- ▶ Patient name, age, sex?

| header |
|--|
| 0.47 44 21 56 49 55 51 57 13 59 45 52 16 44 50 17 44 9.49 99 40 17 81 18 57 60 87 17 40 98 43 69 48 04 56 62 00 1.49 31 73 56 79 14 29 93 71 40 67 53 68 30 03 49 13 36 69 2.70 95 23 04 60 13 42 69 24 68 56 01 32 56 73 37 02 36 91 2.31 16 71 51 67 63 89 41 92 36 54 22 49 90 28 66 33 13 86 4.47 32 60 99 05 45 02 44 75 53 53 78 36 84 20 35 17 12 56 2.98 81 28 64 19 31 56 26 38 40 67 59 54 70 66 18 38 64 56 7.26 20 60 04 62 36 63 54 39 66 08 40 93 64 49 94 23 4.16 05 22 73 59 57 78 54 46 60 14 30 34 63 52 31 38 60 1.56 23 46 75 50 55 52 53 50 45 47 52 54 53 51 52 53 50 8.17 53 26 22 75 21 67 13 39 44 04 42 24 14 09 53 54 92 6.59 05 12 64 35 31 47 55 24 44 20 20 17 54 24 21 53 55 37 6.56 09 68 37 75 89 07 05 44 44 20 60 21 53 51 54 37 58 9.80 81 68 08 94 47 69 28 73 92 12 2.2 17 77 01 89 55 46 4.52 08 83 97 35 99 34 07 97 57 32 36 26 26 79 33 27 98 64 8.96 68 87 57 42 29 72 03 16 39 67 46 58 12 32 43 93 53 69 4.42 16 73 38 25 39 11 24 36 72 10 08 46 29 32 40 62 76 36 0.69 36 41 72 30 23 88 34 62 99 68 82 67 59 85 74 09 36 14 0.73 35 29 78 31 90 02 74 31 49 71 40 06 01 16 23 57 06 54 1.70 74 71 57 01 54 63 16 32 33 46 61 87 52 01 89 18 67 46 |

■ Example

- ▶ Quantify the amount of antibodies

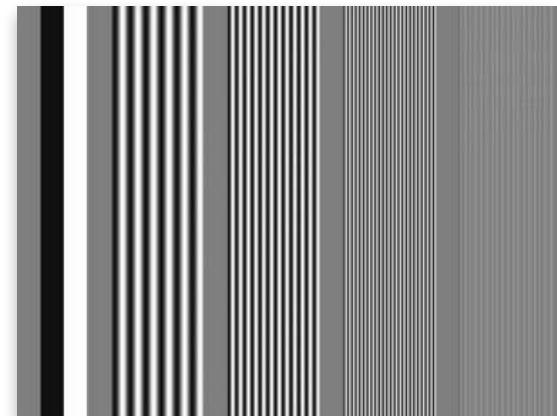

32754 pixels:
how many μm^2 ?

Spatial resolution

- ▶ It's a measure of the smallest discernible detail in an image
 - i.e. the ability to differentiate two objects in the image
- ▶ Can be expressed in many ways:
 - *pixel count*, e.g. megapixels
 - *dots (pixel) per unit distance*, e.g. DPI (dots per inch) or PPI (points per inch)
- ▶ **NB:** image size by itself does not tell the complete story
 - To be meaningful, spatial resolution must be stated **with respect to spatial units**
 - It depends on the **properties of the system** creating the image
 - Example (from wikipedia)

High pixel count,
but probably
low-cost lenses

Lower pixel count,
but probably
better lenses

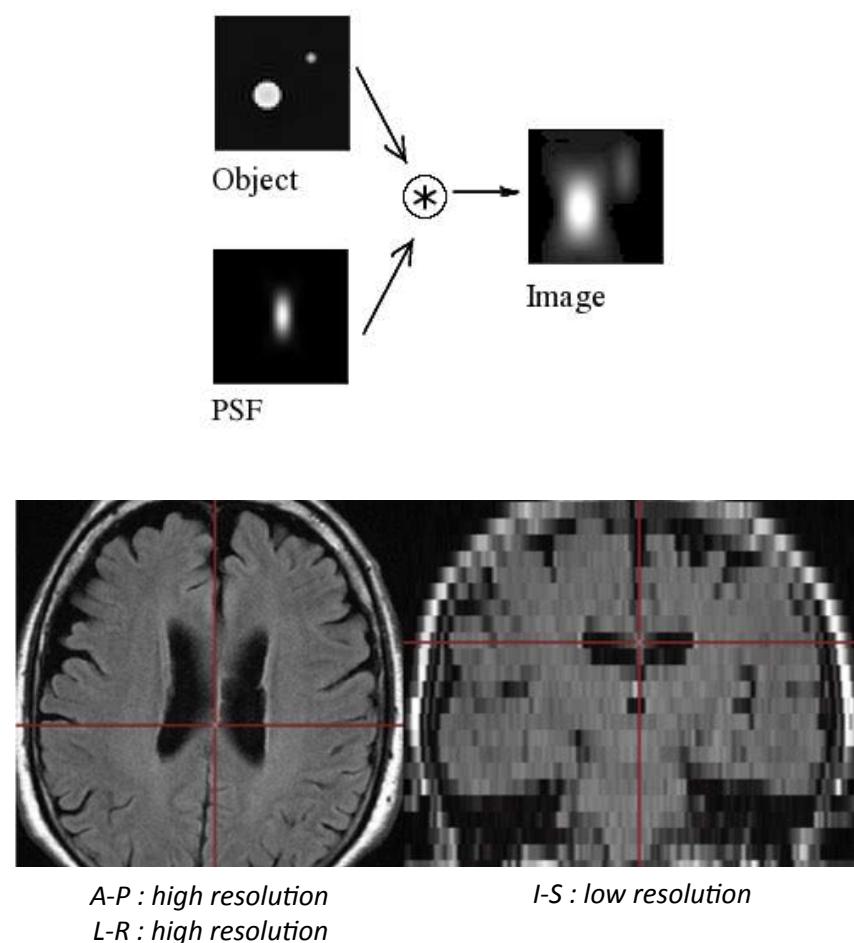

Important image properties

(3/7)

In biomedical images, resolution depends on many factors

- ▶ Nominal ability to resolve fine details → intrinsic blur
- ▶ Point spread function (PSF) = response of an imaging system to a point source
- ▶ High resolution = distinguish *smaller* objects

| TABLE 1-1 THE LIMITING SPATIAL RESOLUTIONS OF VARIOUS MEDICAL IMAGING MODALITIES. THE RESOLUTION LEVELS ACHIEVED IN TYPICAL CLINICAL USAGE OF THE MODALITY ARE LISTED | | |
|---|--|---|
| MODALITY | SPATIAL RESOLUTION (mm) | COMMENTS |
| Screen film radiography | 0.08 | Limited by focal spot size and detector resolution |
| Digital radiography | 0.17 | Limited by size of detector elements and focal spot size |
| Fluoroscopy | 0.125 | Limited by detector resolution and focal spot size |
| Screen film mammography | 0.03 | Highest resolution modality in radiology, limited by same factors as in screen film radiography |
| Digital mammography | 0.05–0.10 | Limited by same factors as digital radiography |
| Computed tomography | 0.3 | About $\frac{1}{2}$ mm pixels |
| Nuclear medicine planar imaging | 2.5 (detector face), 5 (10 cm from detector) | Spatial resolution degrades substantially with distance from detector |
| Single photon emission computed tomography | 7 | Spatial resolution worst towards the center of cross-sectional image slice |
| Positron emission tomography | 5 | Better spatial resolution than the other nuclear imaging modalities |
| Magnetic resonance imaging | 1.0 | Resolution can improve at higher magnetic fields |
| Ultrasound imaging (5 MHz) | 0.3 | Limited by wavelength of sound |

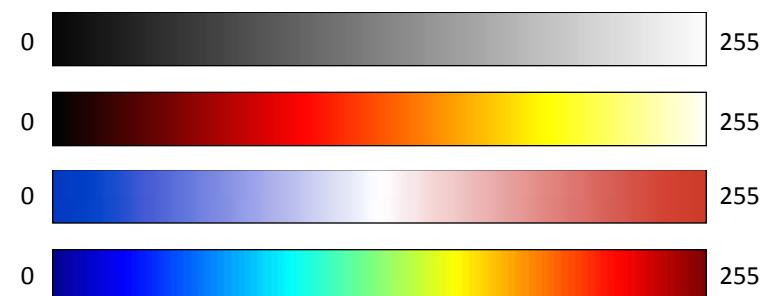

NB: acquisition can be anisotropic!

■ Intensity resolution (a.k.a. pixel/voxel depth)

- ▶ It's the smallest discernible change in intensity levels
- ▶ Number of bits to encode the information in each pixel/voxel
- ▶ Typical data types:
 - signed/unsigned byte (8-bit)
 - signed/unsigned short (16-bit)
 - signed/unsigned int (32-bit)
 - float (32-bit) and double (64-bit)

■ NB: photometric interpretation

- ▶ Grayscale (e.g. CT and MRI)
 - Intensity of physical phenomenon, no a real "color"
 - The "color" is associated when displaying using *colormaps*
- ▶ Color palette or indexed (e.g. SPECT and PET)
 - Image must be displayed with color *stored* in the voxel

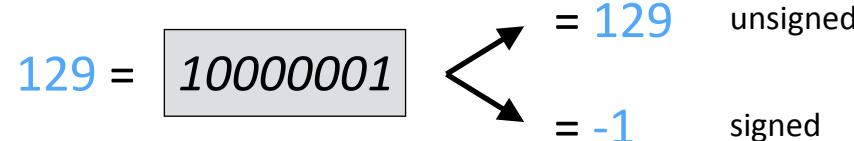

NB: attention to jet/rainbow colormap

Important image properties

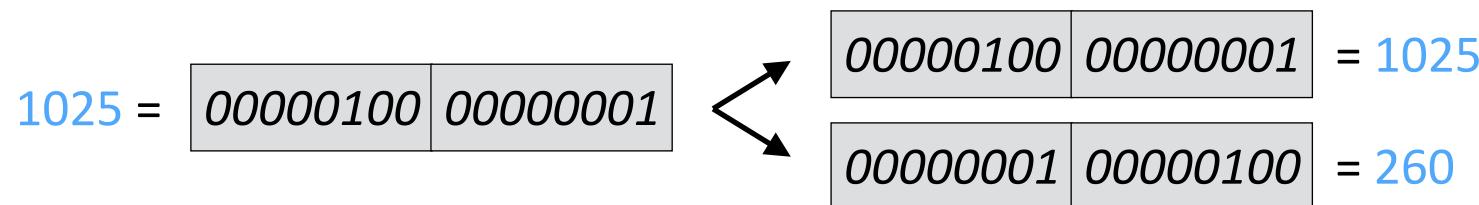

(5/7)

NB: typical mistakes when opening an image

Signed or unsigned?

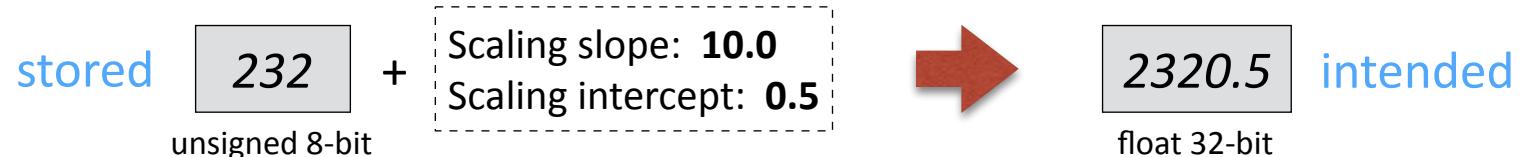

Endian-ness?

Is data scaled?

- Often, values are stored as *integers* but *scaling parameters* are given in the header

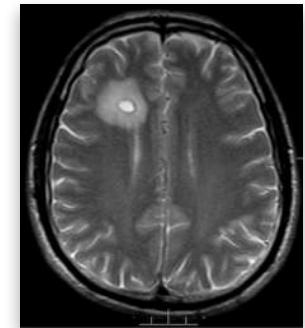

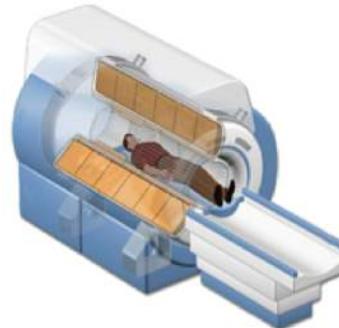

- NB: always perform post-processing in float!

Important image properties

(6/7)

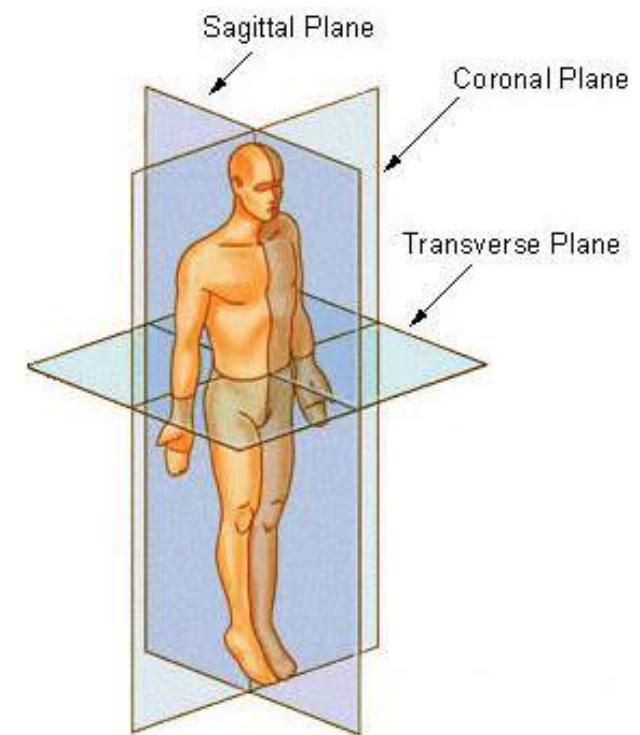

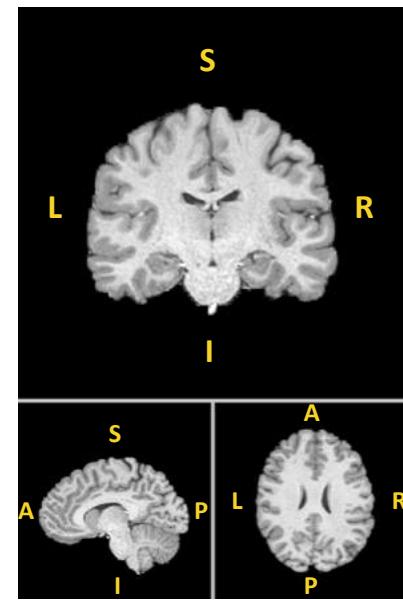

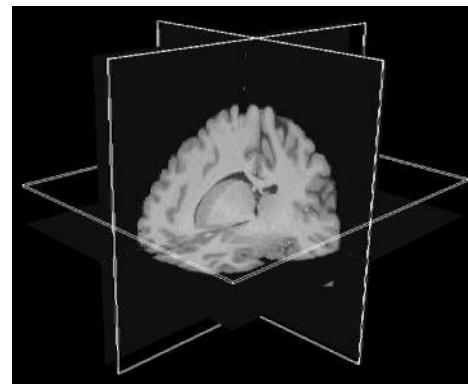

■ Image orientation

- For some analyses, it is **very important** to know the *exact location* of the subject/sample inside the scanner
 - e.g. in which hemisphere is the lesion? Left or right?

■ Usually, medical images displayed by *anatomical planes*

- Sagittal
 - divides *left (L)* and *right (R)*
- Coronal
 - divides *anterior (A)* and *posterior (P)*
- Transverse (or axial)
 - divides *superior (S)* and *inferior (I)*

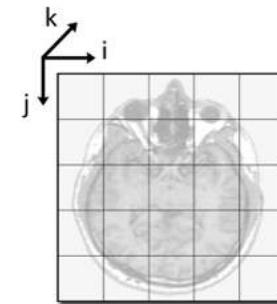

Important image properties

(7/7)

Coordinate systems

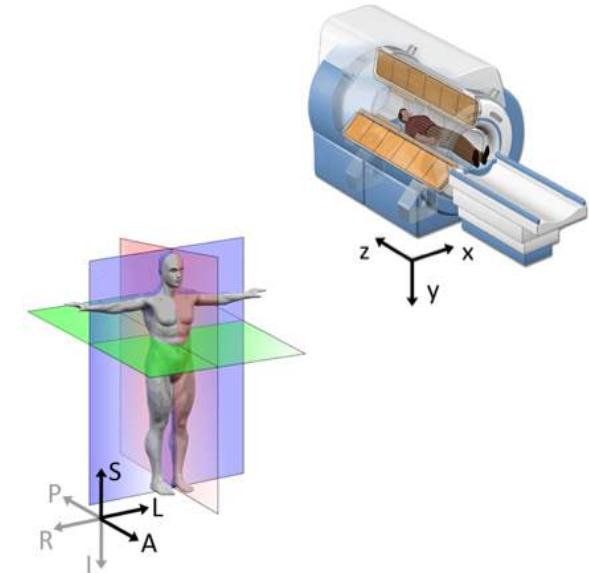

► Image space (i, j, k)

- voxel indices, no notion of “*physical dimensions*”

► World space (x, y, z)

- actual coordinates [in mm] w.r.t. the scanner
- scaling, rotation and translation

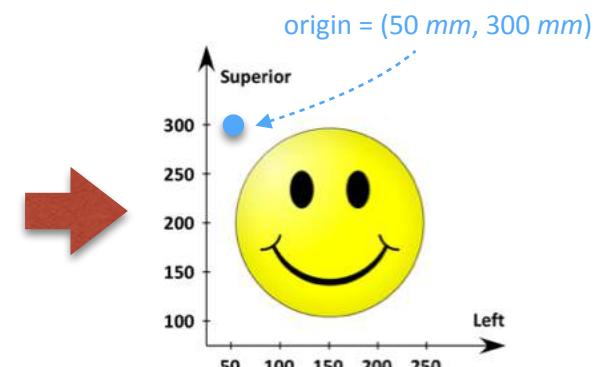

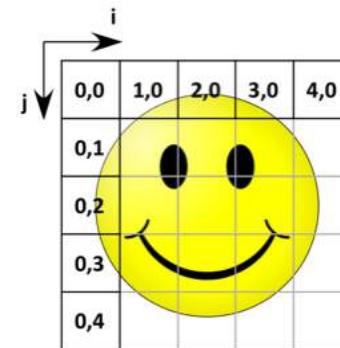

► Patient space (L, A, S)

- coordinates w.r.t. anatomical planes

Transformation matrix

$$\begin{pmatrix} x_1 \\ x_2 \\ x_3 \\ 1 \end{pmatrix} = \begin{pmatrix} A_{11} & A_{12} & A_{13} & t_1 \\ A_{21} & A_{22} & A_{23} & t_2 \\ A_{31} & A_{32} & A_{33} & t_3 \\ 0 & 0 & 0 & 1 \end{pmatrix} \begin{pmatrix} i \\ j \\ k \\ 1 \end{pmatrix}$$

rotation/scale translation

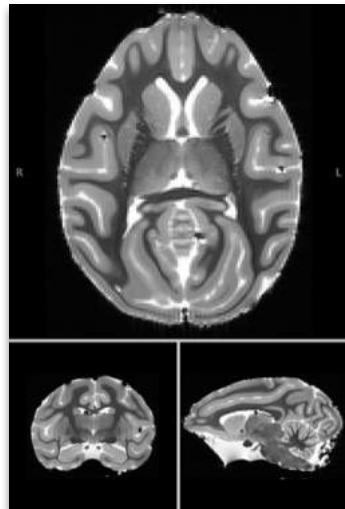

► Homogeneous coordinates

► Stored in the header

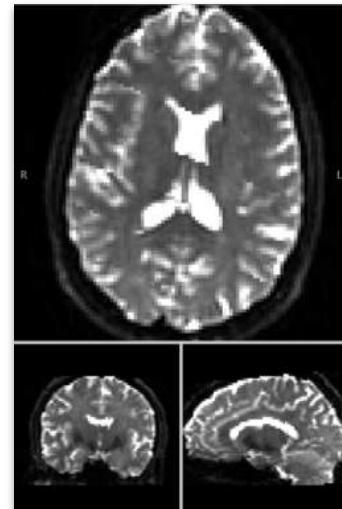

$$IJtoLS = \begin{pmatrix} 50 & 0 & 50 \\ 0 & -50 & 300 \\ 0 & 0 & 1 \end{pmatrix}$$

■ Trade-off between *quality* and *patient comfort*

- ▶ usually, higher quality requires longer acquisitions

Monkey :
- *ex-vivo*
- 1 week

Human :
- *in-vivo*
- 25 minutes

■ Main criteria for **quality assessment**:

- 1) Presence of artifacts
- 2) Spatial resolution
- 3) Noise level
- 4) Image contrast

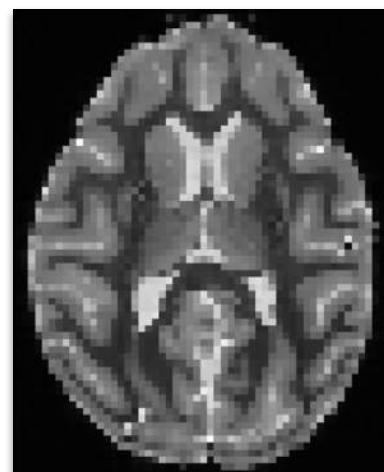

1) Presence of artifacts

2) Spatial resolution

$0.5 \times 0.5 \times 0.5 \text{ mm}$

$1.0 \times 1.0 \times 1.0 \text{ mm}$

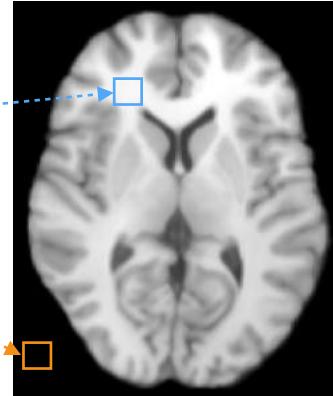

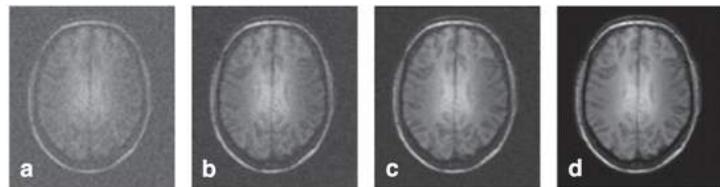

3) Signal-to-noise ratio

- ▶ Many different definitions

- ▶ A common one is:

$$\text{SNR} = \frac{\mu_s}{\sigma_N}$$

- ▶ Averaging improves SNR:

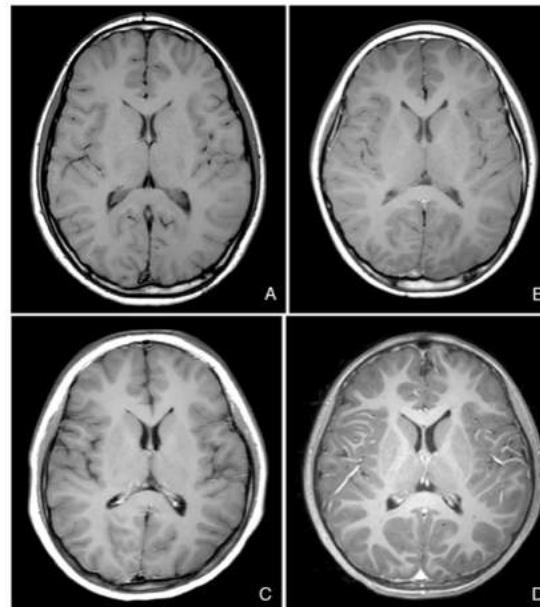

4) Contrast-to-noise ratio

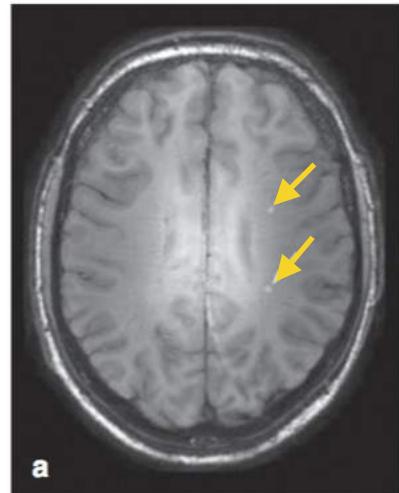

- ▶ Common definition:

$$\text{CNR}_{AB} = \frac{C_{AB}}{\sigma_N} = \frac{|S_A - S_B|}{\sigma_N}$$

where $C_{AB} = |S_A - S_B|$ is the contrast between region A and B

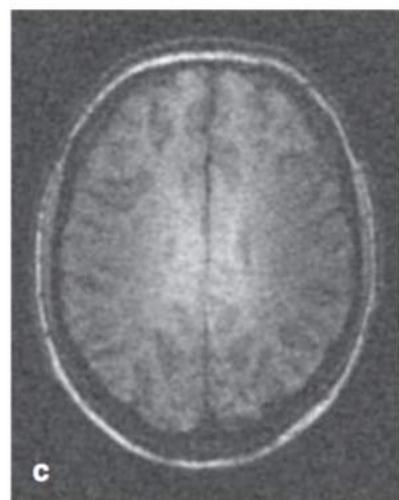

All factors affect diagnostic power

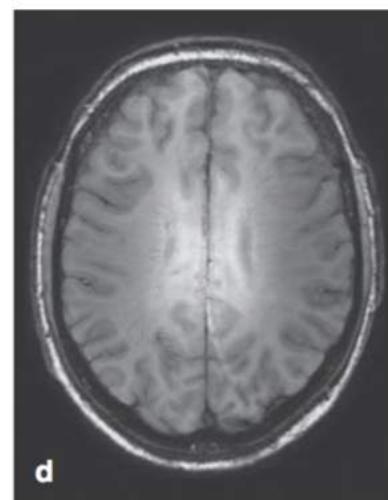

multiple sclerosis lesions
are visible
in the original image

lower resolution

lower SNR

reduced CNR

■ **Image file formats** are standardized means of *organizing* and *storing* digital images

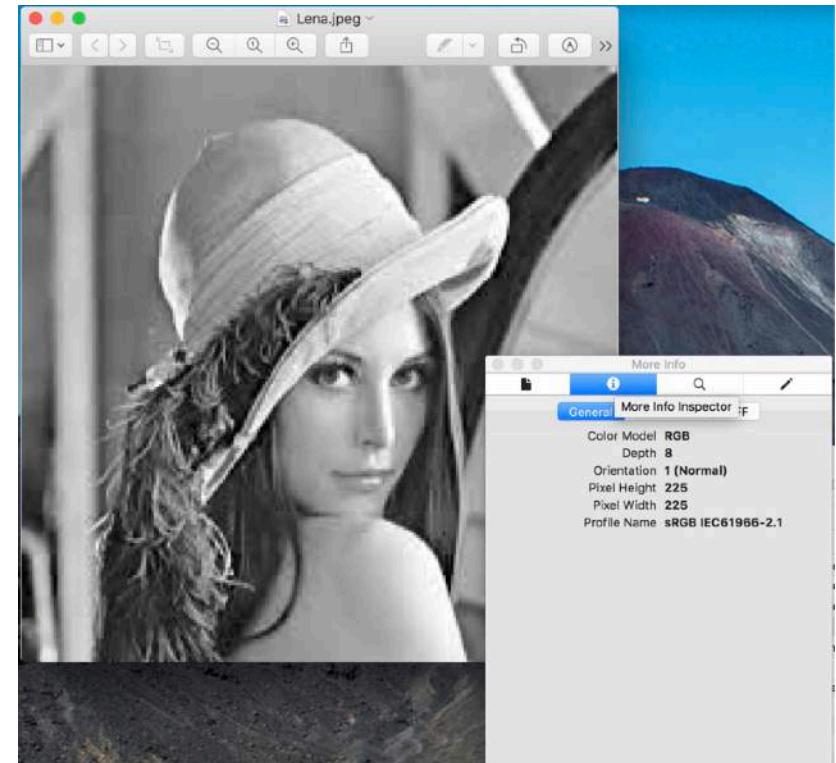

■ The **pixel data** is stored along with an header containing the **metadata**

- ▶ pixel depth, image size ...
- ▶ camera parameters (e.g. exposure)
- ▶ GPS location
- ▶ ...

■ Pixel data can be **compressed**

- ▶ **Lossless**: no information is lost
(but low/mild compression rates)
- ▶ **Lossy**: some information can be lost
(but higher compression rates)

■ Major file formats

| File Name | Description |
|---|---|
| JPEG/JPG (Joint Photographers' Expert Group) | Most popular lossy image format. Allows users to specify what level of compression they desire. |
| PNG (Portable Network Graphics) | Best of lossless image formats. Widely supported across web. Allows you to include an alpha channel within file. |
| BMP (BitMaP) | Would avoid if possible. They offer little to no compression which results in unnecessarily large files. |
| TIFF/TIF (Tagged Image File Format) | Offers both compressed and uncompressed versions. Compressed are similar to PNG and uncompressed is similar to BMP. |
| PDF (Portable Document Format) | Most widely used document format. Great vector image format. Created by Adobe. |
| EPS (Encapsulated PostScript) | Most common vector image format. Standard format for print industry. |
| GIF (Graphics Interchange Format) | Lossless format that supports both animated and static images. Great for webpage banner ads. |

■ Many libraries to *open, save, manipulate and visualize* images

■ e.g. MATLAB

- ▶ `I = imread('picture_01.jpeg');`
- ▶ `I = imread('picture_02.png');`
- ▶ `[M, N] = size(I);`
- ▶ `imshow(I);`
- ▶ `imwrite(I, 'my_image.jpeg');`
- ▶ `H = imfinfo('lena256.bmp');`
